special warfare work. This Manual includes methods for fabricating explosives, detonators, propellants, shaped charges, small arms, mortars, incendiaries, delays, switches, and similar items from indigenous materials.

2. Safety and Reliability

Each item was evaluated both theoretically and experimentally to assure safety and reliability. A large number of items were discarded because of inherent hazards or unreliable performance. Safety warnings are prominently inserted in the procedures where they apply but it is emphasized that safety is a matter of attitude. It is a proven fact that men who are alert, who think out a situation, and who take correct precautions have fewer accidents than the careless and indifferent. It is important le going to the work will be followed by the letter; all work should be done in a neat and orderly manner. In the manufacture explosives, detonators, propellants and incendiaries, equipment must be kept clean and such energy concentrations as sparks, friction, impact, hot objects, flame, chemical reactions, and excessive pressure should be avoided.

These items were found to be effective in most environments; however, samples should be made and tested remotely prior to actual use of assure proper performance. Chemical items should be used as soon as possible after preparation and kept free of moisture, dirt, and the above energy concentrations. Special care should be taken in any attempt at substitution or use of items for purposes other than that specified or intended.

5. PLASTIC EXPLOSIVE FILLER

A plastic explosive filler can be made from potassium chlorate and petroleum jelly. This explosive can be detonated with commercially No. 6 or any military blasting cap.

Piece of round stick

Wide bowl or other container for mixing ingredients.

PROCEDURE

1. Spread potassium chlorate crystals thinly on a hard surface. Roll the round stick over crystals to crush into a very fine powder until it looks like face powder or wheat flour.

2. Place 9 parts powdered potassium chlorate and 1 part petroleum jelly in a wide bowl or similar container. Mix ingredients with hands (bread) until a uniform paste is obtained.

Store explosive in a waterproof container until ready to use.
Section 1
No. 2
POTASSIUM NITRATE

Potassium nitrate (sulphur) can be extracted from many natural sources and can be used to make nitric acid, black powder and many pyrotechnics. The yield ranges from 1 to 10% by weight, depending on the fertility of the soil.

MATERIALS

Nitrate bearing earth or other material, about 3-1/2 gallons (13-1/2 liters)

Fine wood ashes, about 1/2 cup (1/8 liter)

Bucket or similar container, about 5 gallons (19 liters) in volume (Plastic, metal, or wood)

2 pieces of finely woven cloth, each slightly larger than bottom of bucket

Shallow pan or dish, at least as large as bottom of bucket

Shallow heat resistant container (ceramic, metal, etc.)

Water – 1-3/4 gallons (6-3/4 liters)

Abl, knife, screwdriver, or other hole producing instrument

Alcohol about 1 gallon (4 liters) (whiskey, rubbing alcohol, etc.)

Heat source (fire, electric heater, etc.)

Paper

Tape

NOTE: Only the ratios of the amounts of ingredients are important. Thus, for twice as much potassium nitrate, double quantities used.

PROCEDURE:

1. Punch holes in bottom of bucket. Spread one piece of cloth over holes inside of bucket.

2. Place wood ashes on cloth and spread to make a layer about the thickness of the cloth. Place second piece of cloth on top of ashes.

3. Place dirt in bucket.

SOURCE

Soil containing old decayed vegetable or animal matter

Old cellars and/or farm dirt floors

Earth from old burial grounds

Decayed stone or mortar building foundations

Totally burned whitish wood ash powder

Totally burned paper (black)

4. Place bucket over shallow container. Bucket may be supported on sticks if necessary.

5. Boil water and pour it over earth in bucket a little at a time. Allow water to run through holes in bucket into shallow container. Be sure water goes through all of the earth. Allow drained liquid to cool and settle for 1 to 2 hours.

NOTE: Do not pour all of the water at once, since this may cause stoppage.

6. Carefully drain off liquid into heat resistant container. Discard any sludge remaining in bottom of the shallow container.

7. Boil mixture over hot fire for at least 2 hours. Small grains of salt will begin to appear in the solution. Scoop these out as they form, using any type of improvised strainer (paper, etc.).

8. When liquid has boiled down to approximately half its original volume, remove from fire and let sit. After half an hour add an equal volume of alcohol. When mixture is poured through paper, small white crystals will collect on top of it.

9. To purify the potassium nitrate, re-dissolve the dry crystals in the smallest possible amount of boiled water. Remove any salt crystals that appear (Step 7); pour through an improvised filter made of several pieces of paper and evaporate or gently heat the concentrated solution to dryness.

10. Spread crystals on flat surface and allow to dry. The potassium nitrate crystals are now ready for use.
**Section I**

**No. 4**

**NITRIC ACID**

Nitric acid is used in the preparation of many explosives, incendiary mixtures, and acid delay timers. It may be prepared by distilling a mixture of potassium nitrate and concentrated sulfuric acid.

**MATERIAL REQUIRED:**

- Potassium nitrate (2 parts by volume)
- Concentrated sulfuric acid (1 part by volume)
- 2 bottles or ceramic jugs (narrow necks are preferable)
- Pot or frying pan
- Heat source (wood, coal, or charcoal)
- Tape (paper, electrical, masking, etc., but not cellophane)
- Paper or rags

**SOURCES:**

- Drug Store
- Improvised (Section I, No. 3)
- Motor vehicle batteries
- Industrial plants

**IMPORTANT:** If sulfuric acid is obtained from a motor vehicle battery, concentrate it by boiling it until white fumes appear. DO NOT INHALE FUMES.

**NOTE:** The amount of nitric acid produced is the same as the amount of potassium nitrate. Thus, for 2 tablespoons of nitric acid, use 2 tablespoons of potassium nitrate and 1 tablespoon of concentrated sulfuric acid.

**PROCEDURE:**

1. Place dry potassium nitrate in bottle or jug. Add sulfuric acid. Do not fill bottle more than 1/4 full. Mix until paste is formed.

**CAUTION:** Sulfuric acid will burn skin and destroy clothing. If any is spilled, wash it away with a large quantity of water. Fumes are also dangerous and should not be inhaled.

2. Wrap paper or rags around necks of 2 bottles. Securely tape necks of bottles together. Be sure bottles are flush against each other and that there are no air spaces.

3. Support bottles on rocks or cans so that empty bottle is slightly lower than bottle containing paste so that nitric acid that is formed in receiving bottle will not run into other bottle.

4. Build fire in pot or frying pan.

5. Gently heat bottle containing mixture by moving fire in and out. As red fumes begin to appear periodically pour cool water over empty receiving bottle. Nitric acid will begin to form in the receiving bottle.

**CAUTION:** Do not overheat or wet bottle containing mixture or it may shatter. As an added precaution, place bottle to be heated in heat resistant container filled with sand or gravel. Heat this outer container to produce nitric acid.

6. Continue the above process until no more red fumes are formed. If the nitric acid formed in the receiving bottle is not clear (cloudy) pour it into cleaned bottle and repeat Steps 2 - 6.

**CAUTION:** Nitric acid will burn skin and destroy clothing. If any is spilled, wash it away with a large quantity of water. Fumes are also dangerous and should not be inhaled.

Nitric acid should be kept away from all combustibles and should be kept in a sealed ceramic or glass container.

---

**Section I**

**No. 5**

**INITIATOR FOR DUST EXPLOSIONS**

An initiator which will initiate common material to produce dust explosions can be readily and easily constructed. This type of charge is ideal for the destruction of enclosed areas such as rooms or buildings.

**MATERIAL REQUIRED:**

- A flat can, 3 in. (8 cm) diameter and 1-1/2 in. (3-3/4 cm) high. A 6-1/2 ounce Tuna can serves the purpose quite well.
- Blasting cap
- Explosive
- Aluminum (may be wire, cut sheet, flattened can or powder
- Large nail, 4 in. (10 cm) long
- Wooden rod - 1/4 in. (6 mm) diameter
- Flour, gasoline and powder or chipped aluminum

**NOTE:** Plastic explosives (Comp. C-4, etc.) produce better explosions than cast explosives (Comp. B, etc.).

**PROCEDURE:**

1. Using the nail, press a hole through the side of the Tuna can 3/8 to 1/2 inch (1 to 1-1/2 cm) from the bottom. Using a rotating and lever action, enlarge the hole until it will accommodate the blasting cap.
2. Place the wooden rod in the hole and position the end of the rod at the center of the can.

3. Press explosive into the can, being sure to surround the rod, until it is 3/4 inch (2 cm) from top of the can. Carefully remove the wooden rod.

4. Place the aluminum metal on top of the explosive.

5. Just before use, insert the blasting cap into the cavity made by the rod. The initiator is now ready for use.

MATERIAL REQUIRED:
- Ammonium nitrate (not less than 32% nitrogen)
- Fuel oil or gasoline and motor oil (1:1 ratio)
- Two flat boards. (At least one of these should be comfortably held in the hand, i.e., 2 x 4 and 36 x 36.)
- Bucket or other container for mixing ingredients
- Iron or steel pipe or bottle, tin can or heavy-walled cardboard tube
- Blasting cap
- Wooden rod - 1/4 in. diameter
- Spoon or similar measuring container

PROCEDURE:
1. Spread a thin film of the ammonium nitrate on the large flat board and rub vigorously with the other board until the large particles are crushed into a very fine powder that looks like flour (approx. 10 min).

NOTE: Proceed with Step 2 as soon as possible since the powder may take moisture from the air and become spoiled.

2. Mix one measure (cup, tablespoon, etc.) of fuel oil with 16 measures of the finely ground ammonium nitrate in a dry bucket or other suitable container and stir with the wooden rod. If fuel oil is not available, use one half measure of gasoline and one half measure of motor oil. Store in a waterproof container until ready to use.

3. Spoon this mixture into an iron or steel pipe which has an end cap threaded on one end. If a pipe is not available, you may use a dry tin can, a glass jar or a heavy-walled cardboard tube.
NOTE: Take care not to tamp
or shake the mixture in the pipe. If mixture becomes tightly
packed, one cap will not be sufficient to initiate the
explosive.

4. Insert blasting cap just beneath
the surface of the explosive mix.

NOTE: Confining the open end of the container will add to the effectiveness of the explosive.

16
"RED OR WHITE POWDER" PROPELLANT

"Red or White Powder" Propellant may be prepared in a simple,
safe manner. The formulation described below will result in approximately 2-1/2 pounds of powder. This is a small arms propellant and
should only be used in weapons with 1/2 in. inside diameter or less,
such as the Match Gun or the 7.62 Carbine, but not pistols.

MATERIAL REQUIRED:
Heat source (Kitchen stove or open fire)
2 gallon metal bucket
Measuring cup (8 ounces)
Wooden spoon or rubber spatula
Metal sheet or aluminum foil (at least 18 in. sq.)
Flat window screen (at least 1 ft. sq.)
Potassium nitrate (granulated) 2-1/2 cups
White sugar (granulated) 2 cups
Powdered ferrie oxide (rust) 1/8 cup (if available)
Clear water, 3-1/2 cups

PROCEDURE:

1. Place the sugar, potassium nitrate, and water in the bucket. Heat with a low flame, stirring occasionally until the sugar and potassium nitrate dissolve.

2. If available, add the ferrie oxide (rust) to the solution. Increase the flame under the mixture until it boils gently.

NOTE: The mixture will retain the rust coloration.

3. Stir and scrape the bucket sides occasionally until the mixture is reduced to one quarter of its original volume, then stir continuously.

4. As the water evaporates, the mixture will become thicker until it reaches the consistency of cooked breakfast cereal or homemade fudge. At this stage of thickness, remove the bucket from the heat source, and spread the mass on the metal sheet.

5. While the material cools, score it with the spoon or spatula in crisscrossed furrows about 1 inch apart.

6. Allow the material to air dry, preferably in the sun. As it dries, rescore it occasionally (about every 20 minutes) to aid drying.

7. When the material has dried to a point where it is moist and soft but not sticky to the touch, place a small spoonful on the screen. Rub the material back and forth against the screen mesh with spoon or other flat object until the material is granulated into small worm-like particles.

8. After granulation, return the material to the sun to dry completely.

19
SECTION II
PIPE HAND GRENADE

Hand grenades can be made from a piece of iron pipe. The
filler can be plastic or granular military explosive, improvised
explosive, or propellant from shotgun or small arms ammunition.
MATERIAL REQUIRED
Iron pipe, threaded ends, 1 1/4" Powder Pipe Blasting Cap
Pipe 3" diam., 1" to 8" long.
Two (2) iron pipe caps.
Explosive or propellant
(Commercial or military)
Fuse cord
Hand drill
Pliers

PROCEDURE
1. Place blasting cap on one end of fuse cord and crimp with pliers.

NOTE: To find out how long the fuse cord should be, check the time it takes a known length to burn. If 12 inches burns in 10 seconds, a 6-inch cord will ignite the grenade in 15 seconds.
2. Screw pipe cap to one end of pipe. Place fuse cord with blasting cap into the opposite end so that the blasting cap is near the center of the pipe.
3. Pour explosive or propellant into pipe a little bit at a time. Tap the base of the pipe frequently to settle filler.
4. Drill a hole in the center of the unassembled pipe cap large enough for the fuse cord to pass through.
5. Wipe pipe threads to remove any filler material.
6. Slide the drilled pipe cap over the fuse and screw handtight onto the pipe.

MATERIAL REQUIRED:
Block of TNT or other blasting explosive
Non-Electric Military blasting cap
Fuse Cord
Tape, string, wire or glue

PROCEDURE:
1. Place blasting cap on one end of the fuse cord and crimp with pliers.

NOTE: To find out how long the fuse cord should be, check the time it takes a known length to burn. If 12 inches (30 cm) burns for 30 seconds, a 10 second delay will require a 4 inch (10 cm) fuse.
2. Tape, tie or glue one or two rows of closely packed nails to sides of explosive block. Nails should completely cover the four surfaces of the block.
3. Insert the blasting cap in the hole in the block of explosive. Tape or tie fuse cord securely in place so that it will not fall out when the grenade is thrown.

ALTERNATE USE:
An effective directional anti-personnel mine can be made by placing nails on only one side of the explosive block. For this case, an electric blasting cap can be used.

WINE BOTTLE GRENADE
Effective fragmentation grenades can be made from a block of TNT or other blasting explosive and nails.

MATERIAL REQUIRED:
Glass wine bottle with false bottom (cone shaped)
Plastic or castable explosive
Blasting cap
Gasoline or Kerosene (small amount)
String
Adhesive tape
PROCEDURE:

1. Soak a piece of string in gasoline or kerosene. Double wrap this string around the wine bottle approximately 3 in. (7 1/2 cm) above the top of the cone.

NOTE: A small amount of motor oil added to the gasoline or kerosene will improve results.

2. Ignite the string and allow to burn for 1 to 2 minutes. Then plunge the bottle into cold water to crack the bottle. The top half can now be easily removed and discarded.

3. If electric cap is used, connect blasting cap wires to firing circuit.

NOTE: The effectiveness of this charge can be increased by placing it inside a can, box, or similar container and packing sand or dirt between the charge and the container.

4. Insert grenade into container.

 HOW TO USE:

1. Place blasting cap in the hole in the top of the charge. If non-electric cap is used be sure cap is cramped around fuse and fuse is long enough to provide safe delay.

PROCEDURE:

1. Fasten one piece of string to the closed end of container, making a strong connection. This can be done by punching 2 holes in the can, looping the string through them, and tying a knot.

2. Tie free end of this string to bush, stake, fencepost, etc.

3. Fasten another length of string to the grenade such that it cannot interfere with the functioning of the ignition mechanism of the grenade.

4. String Attached To Can

 HOW TO USE:

1. Carefully withdraw safety pin by pulling on ring. Be sure safety lever is retracted during this operation. Grenade will function in normal manner when trip wire is pulled.
NOTE: In areas where concealment is possible, a greater effect may be obtained by suspending the grenade several feet above ground, as illustrated below.

MORTAR SCRAP MINE
A directional shrapnel launcher that can be placed in the path of advancing troops.

MATERIAL REQUIRED:
Iron pipe approximately 3 ft. (1 meter) long and 2 in. to 4 in. (5 to 10 cm) in diameter and threaded on at least one end. Salvaged artillery cartridge case may also be used.
Threaded cap to fit pipe.
Black powder or salvaged artillery propellant about 1/2 lb. (200 gmas) total.
Electrical igniter (commercial SQUIB or improvised igniter, Section VI, No. 1). Safety or improvised fuse may also be used.
Small stones about 1 in. (2-1/2 cm) in diameter or small size scrap; about 1 lb. (400 gmas) total.
Rags for wadding, each about 20 in. by 20 in. (50 cm x 50 cm)
Paper or bag
Battery and wires
Stick (non-metallic)
Note: Be sure pipe has no cracks or flaws.

PROCEDURE:
1. Screw threaded cap onto pipe.
2. Place propellant and igniter in paper or rag and tie package with string so contents will not fall out.
3. Insert packaged propellant and igniter into pipe until package rests against threaded cap leaving firing leads extending from open end of pipe.
4. Roll rag till it is about 6 in. (15-1/2 cm) long and the same diameter as pipe. Insert rag wadding against packaged propellant igniter. With caution, pack tightly using stick.
5. Insert stones and/or scrap metal into pipe.
6. Insert second piece of rag wadding against stones and/or metal scrap. Pack tightly as before.

HOW TO USE:
1. Bury pipe in ground with open end facing the expected path of the enemy. The open end may be covered with cardboard and a thin layer of dirt or leaves as camouflage.
2. Connect firing leads to battery and switch. Mine can be remotely fired when needed or attached to trip device placed in path of advancing troops.

NOTE: A NON-ELECTRICAL ignition system can be substituted for the electrical ignition system as follows.
1. Follow above procedure, substituting safety fuse for igniter.
2. Light safety fuse when ready to fire.

COKE BOTTLE SHAPED CHARGE
This shaped charge will penetrate 3 in. (7-1/2 cm) of armor. (It will disable a vehicle if placed on the engine or engine compartment).

MATERIAL REQUIRED:
Glass Coke bottle, 6-1/2 oz. size
Plastic or castable explosive, about 1 lb. (454 gm)
Blasting cap
Metal cylinder, open at both ends, about 6 in. (15 cm) long and 2 in. (5 cm) inside diameter. Cylinder should be heavy walled for best results.
Plug to fit mouth of coke bottle (rags, metal, wood, paper, etc.)
Non-metal rod about 1/4 in. (6 mm) in diameter and 8 in. (20 cm) or more in length.
Tape or string
2 tin cans if castable explosive is used (See Section II, No. 3)

NOTE: Cylinder may be cardboard, plastic, etc. if castable explosive is used.

PROCEDURE:

1. Place plug in mouth of bottle.

2. Place cylinder over top of bottle until bottom of cylinder rests on widest part of bottle. Tape cylinder to bottle. Container should be straight on top of bottle.

3. If plastic explosive is used:
   a. Place explosive in cylinder a little at a time tamping with rod until cylinder is full.
   b. Press the rod about 1/2 in. (1 cm) into the middle of the top of the explosive charge to form a hole for the blasting cap.

4. If castable explosive is used, follow procedure of Wine Bottle Cone Charge, Section II, No. 3, Step 4, a through i.

HOW TO USE:
Method 1. If electrical blasting cap is used:

1. Place blasting cap in hole in top of explosive.

CAUTION: Do not insert blasting cap until charge is ready to be detonated.

CAUTION: Be sure that base of bottle is flush against target and that there is nothing between the target and the base of the bottle.

3. Connect leads from blasting cap to firing circuit.
   Method II. If non-electrical blasting cap is used:
   1. Crimp cap around fuse.
   
   CAUTION: Be sure fuse is long enough to provide a safe delay.
   2. Follow steps 1, 2, and CAUTIONS of Method I.

3. Light fuse when ready to fire.

Section II

CYLINDRICAL CAVITY SHAPED CHARGE

A shaped charge can be made from common pipe. It will penetrate 1-1/2 in. (3-1/2 cm) of steel, producing a hole 1-1/2 in. (3-1/2 cm) in diameter.

MATERIAL REQUIRED:
Iron or steel pipe, 2 to 2-1/2 in. (5 to 6-1/2 cm) in diameter and 3 to 4 in. (7-1/2 to 10 cm) long
Metal pipe, 1/2 to 3/4 in. (1-1/2 to 2 cm) in diameter and 1-1/2 in. (3-1/2 cm) long, open at both ends. (The wall of the pipe should be as thin as possible.)
Blasting cap
Non-metallic rod, 1/4 in. (6 mm) in diameter
Plastic or castable explosive
2 metal cans of different sizes
Stick or wire
Heat source

PROCEDURE:

1. If plastic explosive is used:
   a. Place larger pipe on flat surface. Hand pack and tamp explosive into pipe. Leave approximately 1/4 in. (6 mm) space at top.

b. Push rod into center of explosive. Enlarge hole in explosive to diameter and length of small pipe.

c. Insert small pipe into hole.
**IMPORTANT:** Be sure direct contact is made between explosive and small pipe. Tamp explosive around pipe by hand if necessary.

d. Make sure that there is 1/4 in. (6 mm) empty space above small pipe. Remove explosive if necessary.

e. Turn pipe upside down and push rod 1/2 in. (1-1/4 cm) into center of opposite end of explosive to form a hole for the blasting cap.

**CAUTION:** Do not insert blasting cap in hole until ready to fire shaped charge.

2. If TNT or other castable explosive is used:

a. Follow procedure, Section II, No. 3, Step 4, Parts a, b, c, including CAUTIONS.

b. When all the explosive has melted, remove the inner container and stir the molten explosive until it begins to thicken.

c. Place large pipe on flat surface. Pour explosive into pipe until it is 1-3/4 in. (4 cm) from the top.

d. Place small pipe in center of large pipe so that it rests on top of explosive. Holding small pipe in place, pour explosive around small pipe until explosive is 1/4 in. (6 mm) from top of large pipe.

e. Allow explosive to cool. Break crust that forms on top of the charge during cooling with a wooden stick and add more explosive. Do this as often as necessary until explosive is 1/4 in. (6 mm) from top.

**HOW TO USE:**

**Method I** - If electrical blasting cap is used:

1. Place blasting cap in hole made for it.

**CAUTION:** Do not insert blasting cap until charge is ready to fire.

2. Place other end of pipe flush against the target. Fasten pipe to target by any convenient means, such as by placing tape or string around target and top of pipe. If target is not flat and horizontal.

**CAUTION:** Be sure that base of pipe is flush against target and that there is nothing between the target and the base of the pipe.

3. Connect leads from blasting cap to firing circuit.

**Method II** - If non-electrical blasting cap is used:

1. Crimp cap around fuse.

**CAUTION:** Be sure fuse is long enough to provide a safe delay.

3. Follow Steps 1, 2, and CAUTION of Method I.

36
No. 1
PIPE PISTOL FOR 9 MM AMMUNITION

A 9 mm pistol can be made from 1/4" steel gas or water pipe and fittings.

**MATERIAL REQUIRED**

1/4" nominal size steel pipe 4 to 6 inches long with threaded ends.

1/4" Solid pipe plug
Two (2) steel pipe couplings
Metal strap - roughly 1/8" x 1/4" x 5"
Two (2) elastic bands
Flat head nail - 6D or 8D (approx 1/16" diameter)
Two (2) wood screws #8
Wood 5/8" x 5/8" x 1"
Drill
1/4" wood or metal rod, (approx 8" long)

**PROCEDURE**

1. Carefully inspect pipe and fittings.

   a. Make sure that there are NO cracks or other flaws in the pipe or fittings.

   b. Check inside diameter of pipe using a 9 mm cartridge as a gauge. The bullet should closely fit into the pipe without forcing but the cartridge case SHOULD NOT fit into pipe.

   c. Outside diameter of pipe MUST NOT BE less than 1 1/2 times bullet diameter (0.536 inches; 1.37 cm)

2. Drill a 9/16" (1.43 cm) diameter hole 3/8" approximately 1 cm) into one coupling to remove the thread.

   Drilled section should fit tightly over smooth section of pipe.

3. Drill a 25/64" (1 cm) diameter hole 3/4" (1.9 cm) into pipe. Use cartridge as a gauge; when a cartridge is inserted into the pipe, the base of the case should be even with the end of the pipe. Thread coupling tightly onto pipe, drilled end first.
4. Drill a hole in the center of the pipe plug just large enough for the nail to fit through.

**HOLE MUST BE CENTERED IN PLUG.**

5. Push nail through plug until head of nail is flush with square end. Cut nail off at other end 1/16" (.158 cm) away from plug. Round off end of nail with file.

6. Bend metal strap to "U" shape and drill holes for wood screws. File two small notches at top.

7. Saw or otherwise shape 1" (2.54 cm) thick hard wood into stock.

8. Drill a 9/16" diameter (1.4 cm) hole through the stock. The center of the hole should be approximately 1/2" (1.27 cm) from the top.

9. Slide the pipe through this hole and attach front coupling. Screw drilled plug into rear coupling.

NOTE: If 9/16" drill is not available cut a "V" groove in the top of the stock and tape pipe securely in place.

10. Position metal strap on stock so that top will hit the head of the nail. Attach to stock with wood screw on each side.

11. String elastic bands from front coupling to notch on each side of the strap.

**SAFETY CHECK - TEST FIRE PISTOL BEFORE HAND FIRING**

1. Locate a barrier such as a stone wall or large tree which you can stand behind in case the pistol ruptures when fired.

2. Mount pistol solidly to a table or other rigid support at least ten feet in front of the barrier.

3. Attach a cord to the firing strap on the pistol.

4. Holding the other end of the cord, go behind the barrier.

5. Pull the cord so that the firing strap is held back.

6. Release the cord to fire the pistol. (If pistol does not fire, shorten the elastic bands or increase their number.)

**IMPORTANT:** Fire at least five rounds from behind the barrier and then re-inspect the pistol before you attempt to hand fire it.

**HOW TO OPERATE PISTOL**

1. To Load
   a. Remove plug from rear coupling.
   b. Place cartridge into pipe.
   c. Replace plug.

2. To Fire
   a. Pull strap back and hold with thumb until ready.
   b. Release strap.
   **To Remove Shell Case**
   a. Remove plug from rear coupling.
   b. Insert 1/4" diameter steel or wooden rod into front of pistol and push shell case out.
SHOTGUN (12 GAUGE)

A 12-gauge shotgun can be made from 3/4" water or gas pipe and fittings.

MATERIALS REQUIRED

Wood 2" x 4" x 32"
3/4" nominal size water or gas pipe 20" to 30" long threaded on one end.
3/4" steel coupling
Solid 3/4" pipe plug
Metal strap (1/4" x 1/16" x 4")
Twine, heavy (100 yards approximately)
3 wood screws and screwdriver
Flat head nail 6D or 8D
Hand drill
Saw or knife
File
Shellac or lacquer
Elastic Bands

PROCEDURE

1. Carefully inspect pipe and fittings.
   a. Make sure that there are no cracks or other flaws.
   b. Check inside diameter of pipe. A 12-gauge shot shell should fit into the pipe but the brass rim should not fit.
   c. Outside diameter of pipe must be at least 1 in. (2.54 cm).

2. Cut stock from wood using a saw or knife.

3. Cut a 3/8" deep "V" groove in top of the stock.

4. Turn coupling onto pipe until tight.

5. Coat pipe and "V" groove of stock with shellac or lacquer and, while still wet, place pipe in "V" groove and wrap pipe and stock together using two heavy layers of twine. Coat twine with shellac or lacquer after each layer.

6. Drill a hole through center of pipe plug large enough for nail to pass through.

7. File threaded end of plug flat.

8. Push nail through plug and cut off flat 1/32" past the plug.

9. Screw plug into coupling.

10. Bend 4" metal strap into "L" shape and drill hole for wood screw. Notch metal strap on the long side 1/2" from bend.

11. Position metal strap on stock so that top will hit the head of the nail. Attach to stock with wood screw.

12. Place screw in each side of stock about 4" in front of metal strap. Pass elastic bands through notch in metal strap and attach to screw on each side of the stock.

SAFETY CHECK - TEST FIRE SHOTGUN BEFORE HAND FIRING

1. Locate a barrier such as a stone wall or large tree which you can stand behind in case the weapon explodes when fired.

2. Mount shotgun solidly to a table or other rigid support at least ten feet in front of the barrier.

3. Attach a long cord to the firing strap on the shotgun.

4. Holding the other end of the cord, go behind the barrier.

5. Pull the cord so that the firing strap is held back.

6. Release the cord to fire the shotgun. (If shotgun does not fire, shorten the elastic bands or increase their number.)

IMPORTANT: Fire at least five rounds from behind the barrier and then re-inspect the shotgun before you attempt to shoulder fire it.
**POOR MAN'S JAMES BOND Vol. 2**

**IMPROVISED MUNITIONS**

**How to Operate Shotgun**

1. **To Load**
   a. Take plug out of coupling.
   b. Put shotgun shell into pipe.
   c. Screw plug hand-tight into coupling.

2. **To Fire**
   a. Pull strap back and hold with thumb.
   b. Release strap.

3. **To Unload Gun**
   a. Take plug out of coupling.
   b. Shake out used cartridge.

**Section III**

**Shotshell Dispersion Control**

When desired, shotshell can be modified to reduce shot dispersion.

**Material Required:**

- Shotshell
- Screwdriver or knife
- Any of the following filler materials:
  - Crushed Rice
  - Rice Flour
  - Dry Bread Crumbs
  - Fine Dry Sawdust

**Procedure:**

1. Carefully remove crimp from shotshell using a screwdriver or knife.

**How to Use:**

This round is loaded and fired in the same manner as standard shotshell. The shot spread will be about 2/3 that of a standard round.

**Section III**

**Carbine (7.62 mm Standard Rifle Ammunition)**

A rifle can be made from water or gas pipe and fittings. Standard cartridges are used for ammunition.

**Material Required:**

- Wood approximately 2 in. x 4 in. x 30 in.
- 1/4 in. nominal size iron water or gas pipe 20 in. long threaded at one end.
- Twine, heavy (100 yards approx.)
- 3 wood screws and screwdriver
- Flat head nail about 1 in. long
- Hand drill
- Saw or knife
**POOR MAN'S JAMES BOND Vol. 2**

**IMPROVISED MUNITIONS**

**PROCEDURE:**

1. Inspect pipe and fittings carefully.
   a. Be sure that there are no cracks or flaws.
   b. Check inside diameter of pipe. A .52 mm projectile should fit into 3/8 in. pipe.

2. Cut stock from wood using saw or knife.

3. Cut a 1/4 in. deep "V" groove in top of the stock.

4. Fabricate rifle barrel from pipe.
   a. File or drill inside diameter of threaded end of 20 in. pipe for about 1/4 in. so neck of cartridge case will fit in.
   b. Screw reducer onto threaded pipe using pipe wrench.
   c. Screw short threaded pipe into reducer.
   d. Turn 3/8 pipe coupling onto threaded pipe using pipe wrench. All fittings should be as tight as possible. Do not split fittings.

5. Coat pipe and "V" groove of stock with shellac or lacquer. While still wet, place pipe in "V" groove and wrap pipe and stock together using two layers of twine. Coat twine with shellac or lacquer after each layer.

6. Drill a hole through center of pipe plug large enough for nail to pass through.

7. File threaded end of plug flat.

8. Push nail through plug and cut off rounded 1/32 in. (2 mm) past the plug.

9. Screw plug into coupling.

10. Bend 4 in. metal strap into "L" shape and drill hole for wood screw. Notch metal strap on the long side 1/2 in. from bend.

11. Position metal strap on stock so that top will hit the head of the nail. Attach to stock with wood screw.

12. Place screw in each side of stock about 1 1/2 in. in front of metal strap. Pass elastic bands through notch in metal strap and attach to screw on each side of the stock.

**SAFETY CHECK - TEST FIRE RIFLE BEFORE HAND FIRING**

1. Locate a barrier such as a stone wall or large tree which you can stand behind to test fire weapon.

2. Mount rifle solidly to a table or other rigid support at least ten feet in front of the barrier.

3. Attach a long cord to the firing strap on the rifle.

4. Holding the other end of the cord, go behind the barrier.

5. Pull the cord so that the firing strap is held back.

6. Release the cord to fire the rifle. (If the rifle does not fire, shorten the elastic bands or increase their number.)

**IMPORTANT:** Fire at least five rounds from behind a barrier and then reinspect the rifle before you attempt to shoulder fire it.

**HOW TO OPERATE RIFLE:**

1. **To Load**
   a. Remove plug from coupling.
   b. Put cartridge into pipe.
   c. Screw plug hand-tight into coupling.

2. **To Fire**
   a. Pull strap back and hold with thumb.
   b. Release strap.

3. **To Unload Gun**
   a. Take plug out of coupling.
   b. Drive out used case using stick or tong.
MATERIAL REQUIRED:
- Cartridge case
- 2 long nails having approximately the same diameter as the inside of the primer pocket
- "Strike-anywhere" matches - 2 or 3 are needed for each primer
- Vise
- Hammer
- Knife or other sharp edged instrument

PROCEEDURE:

1. File one nail to a needle point so that it is small enough to fit through hole in primer pocket.
2. Place cartridge case and nail between jaws of vise. Force out fired primer with nail as shown.
3. Remove anvil from primer cup.
4. File down point of second nail until tip is flat.
5. Remove indentations from face of primer cup with hammer and flattened nail.
6. Cut off tips of the heads of "strike-anywhere" matches using knife. Carefully crush the match tips on dry surface with wooden match stick until the mixture is the consistency of sugar.

CAUTION: Do not crush more than 3 match tips at one time or the mixture may explode.

1. Pour mixture into primer cup. Compress mixture with wooden match stick until primer cup is fully packed.
2. Place anvil in primer pocket with legs down.
3. Place cup in pocket with mixture facing downward.
4. Place cartridge case and primer cup between vise jaws, and press slowly until primer is seated into bottom of pocket. The primer is now ready to use.

PIPE PISTOL FOR .45 CALIBER AMMUNITION

A .45 caliber pistol can be made from 3/8 in. nominal diameter steel gas or water pipe and fittings. Lethal range is about 15 yards (10-1/2 meters).

MATERIAL REQUIRED:
- Steel pipe: 3/8 in. (1 cm) nominal diameter and 6 in. (15 cm) long with threaded ends.
- 2 threaded couplings to fit pipe
- Solid pipe plug to fit pipe coupling
- Hard wood, 8-1/2 in. x 6-1/2 in. x 1 in. (21 cm x 16-1/2 cm x 2-1/2 cm)
- Tape or string
- Flat head nail, approximately 1/16 in. (1-1/2 mm) in diameter
- Wood screws, approximately 1/16 in. (1-1/2 mm) in diameter
- Metal strap, 1 in. x 1/4 in. x 1/8 in. (12-1/2 cm x 6 mm x 1 mm)
- Bolt, 4 in. (10 cm) long, with nut (optional)
- Elastic bands
- Drill, 1/16 in. (1-1/2 mm) in diameter, and one having same diameter as bolt (optional)
- Rod, 1/4 in. (6 mm) in diameter and 8 in. (20 cm) long
- Saw or knife

PROCEEDURE:

1. Carefully inspect pipe and fittings.
   a. Make sure that there are no cracks or other flaws in the pipe and fittings.
   b. Check inside diameter of pipe using a .45 caliber cartridge as a gauge. The cartridge case should fit into the pipe snugly but without forcing.
   c. Outside diameter of pipe MUST NOT BE less than 1-1/2 times the bullet diameter.
2. Follow procedure of Section III, No. 1, steps 4, 5, and 6.
3. Cut stock from wood using saw or knife.

<table>
<thead>
<tr>
<th>Inches</th>
<th>Centimeters</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-1/2</td>
<td>4 cm</td>
</tr>
<tr>

<td>20</td>
</tr>
<tr>
<td>1-1/2</td>
<td>4</td>
</tr>
<tr>
<td>5</td>
<td>12-1/2</td>
</tr>
</tbody>
</table>

4. Cut a 3/8 in. (9-1/2 mm) deep groove in top of stock.
5. Screw couplings onto pipe. Screw plug into one coupling.
6. Securely attach pipe to stock using string or tape.

7. Follow procedures of Section III, No. 1, steps 10 and 11.

8. (Optional) Bend bolt for trigger. Drill hole in stock and place bolt in hole so strap will be anchored by bolt when pulled back. If bolt is not available, use strap as trigger by pulling back and releasing.

9. Follow SAFETY CHECK, Section III, No. 1

HOW TO USE:

1. To load:
   a. Remove plug from rear coupling.
   b. Wrap string or elastic band around extractor groove so case will seat into barrel securely.
   c. Place cartridge in pipe.
   d. Replace plug.

2. To Fire:
   a. Pull metal strap back and anchor in trigger.
   b. Pull trigger when ready to fire.

NOTE: If bolt is not used, pull strap back and release.

3. To remove cartridge case:
   a. Remove plug from rear coupling.
   b. Insert rod into front of pistol and push cartridge case out.

WOOD - 28 in. x 4 in. x 1 in. (70 cm x 10 cm x 2.5 cm)
Toy caps or safety fuse or "strike-anywhere matches" (3)
Electrical tape or string
Metal strap, about 4 in. x 1/4 in. x 3/16 in. (10 cm x 6 mm x 4.5 mm)
2 rings, about 1 in. x 12 in. and 1 in. x 3 in. (2-1/2 cm x 30 cm and 2-1/2 cm x 8 cm)
Wood screws
Elastic bands
Metal object (steel rod, bolt with head cut off, etc.), approximately 7/16 in. (11 mm) in diameter, and 7/16 in. (11 mm) long if iron or steel, 1-1/4 in. (31 mm) long if aluminum, 5/16 in. (8 mm) long if lead.
Metal disk 1 in. (2-1/2 cm) in diameter and 1/16 in. (1-1/2 mm) thick Bolt, 3/32 in. (2-1/2 mm) or smaller in diameter and nut to fit saw or knife

PROCEDURE:
1. Carefully inspect pipe and fittings. Be sure that there are no cracks or other flaws.

2. Drill small hole in center of end cap. If safety fuse is used, be sure it will pass through this hole.

3. Cut stock from wood using saw or knife.

4. Cut 3/8 in. (9-1/2 mm) deep "V" groove in top of stock.

5. Screw end cap onto pipe until finger tight.

6. Attach pipe to stock with string or tape.

7. Bend metal strap into "L" shape and drill holes for wood screw. Noch metal strap on long side 1/2 in. (1 cm) from bend.

8. Position metal strap on stock so that the top will hit the center of hole drilled in end cap.

9. Attach metal disk to strap with nut and bolt. This will deflect blast from hole in end cap when gun is fired. Be sure that head of bolt is centered on hole in end cap.

MATERIAL REQUIRED:
Metal pipe 24 in. (61 cm) long and 3/8 in. (1 cm) in diameter (nominal size) or its equivalent, threaded on one end.
End cap to fit pipe
Safety matches - 3 books of 20 matches each.
10. Attach strap to stock with wood screws.

11. Place screw on each side of stock about 4 in. (10 cm) in front of metal strap. Pass elastic bands through notch in metal strap and attach to screw on each side of stock.

HOW TO USE:

A. When Toy Caps Are Available:

1. Cut off match heads from 3 books of matches with knife. Pour match heads into pipe.

2. Fold one end of 1 in. x 12 in. rag 3 times so that it becomes a one inch square of 3 thicknesses. Place rag into pipe to cover match heads, folded end first. Tap firmly WITH CAUTION.

3. Place metal object into pipe. Place 1 in. x 3 in. rag into pipe to cover projectile. Tap firmly WITH CAUTION.

4. Place 2 toy caps over small hole in end cap. Be sure metal strap will hit caps when it is released.

NOTE: It may be necessary to tape toy caps to end cap.

5. When ready to fire, pull metal strap back and release.

B. When "Strike-Anywhere" Matches Are Available:

1. Follow steps 1 through 3 in A.

2. Carefully cut off tips of heads of 2 "strike-anywhere" matches with knife.

3. Place one tip in hole in end cap. Push in with wooden end of match stick.

4. Place second match tip on a piece of tape. Place tape so match tip is directly over hole in end cap.

5. When ready to fire, pull metal strap back and release.

C. When Safety Fuse Is Available: (Recommended for Booby Trap)

1. Remove end cap from pipe. Knot one end of safety fuse. Thread safety fuse through hole in end cap so that knot is on inside of end cap.

2. Follow steps 1 through 3 in A.

3. Tie several matches to safety fuse near outside of end cap. NOTE: Bare end of safety fuse should be inside match head cluster.

4. Wrap match covers around matches and tie. Striker should be in contact with match bands.

5. Replace end cap on pipe.

6. When ready to fire, pull match cover off with strong, firm, quick motion.

SAFETY CHECK - TEST FIRE GUN BEFORE HAND FIRING

1. Locate a barrier such as a stone wall or large tree which you can stand behind in case the weapon explodes when fired.

2. Mount gun solidly to a table or other rigid support at least ten feet in front of the barrier.

3. Attach a long cord to the firing strap on the gun.

4. Holding the other end of the cord, go behind the barrier.

5. Pull the cord so that the firing strap is held back.

6. Release the cord to fire the gun. (If gun does not fire, shorten the elastic bands or increase their number.)

IMPORTANT: Fire at least five rounds from behind the barrier and then re-inspect the gun before you attempt to shoulder fire it.
POOR MAN'S JAMES BOND Vol. 2

Section III

61
No. 8
RIFLE CARTRIDGE

NOTE: See Section III, No. 5 for reusable primer.

A method of making a previously fired rifle cartridge reusable.

MATERIAL REQUIRED:
Empty rifle cartridge, be sure that it still fits inside gun.
Threaded bolt that fits into neck of cartridge at least 1-1/4 in. (3 cm)
long.
Safety or "strike-anywhere" matches (about 58 matches are needed
for 7.62 mm cartridge)
Rag wad (about 3/4 in. (1-1/2 cm) square for 7.62 mm cartridge)
Knife
Saw

NOTE: Number of matches and size of rag wad depend on particular
 cartridge used.

PROCEDURE:

1. Remove coating on heads of matches by scraping match sticks
with sharp edge.

CAUTION: If wooden "strike-anywhere" matches are used, cut off
tips first. Discard tips or use for
Reusable Primer, Section III, No. 5.

2. Fill previously primed car-
tridge case with match head
coatings up to its neck. Pack
evenly and tightly with match
stick.

CAUTION: Remove head of match stick before packing. In all packing
operations, stand off to the side and pack gently. Do not hammer.

3. Place rag wad in neck
of case. Pack with match
stick from which head was
removed.

4. Saw off head end of bolt so
remainder is approximately the
length of the standard bullet.

5. Place bolt in cartridge case so that it sticks out about the same
length as the original bullet.

NOTE: If bolt does not fit snugly, force paper or match sticks between
bolt and case, or wrap tape around bolt before inserting in case.

Section IV

No. 1
RECOILLESS LAUNCHER

A dual directional scrap fragment launcher which can be placed to
cover the path of advancing troops.

MATERIAL REQUIRED:
Iron water pipe approximately 4 ft. (1 meter) long and 2 to 4 in. (5 to
10 cm) in diameter
Black powder (commercial) or salvaged artillery propellant about 1/2
lb. (200 gms)
Safety or improvised fuse (Section VI, No. 7) or improvised electrical
igniter (Section VI, No. 2)
Stones and/or metal scrap chunks approximately 1/2 in. (1 cm) in diam-
eter — about 1 lb. (450 gms) total
4 rags for wadding, each about 20 in. by 20 in. (50 cm by 50 cm)
Wire
Paper or rag

NOTE: Be sure that the water pipe has no cracks or flaws.

PROCEDURE:

1. Place propellant and igniter in paper or rag and tie with string
so contents cannot fall out.

Packaged
Propellant

Firing Leads

2. Insert packaged propellant and igniter in center of pipe. Pull firing
leads out one end of pipe.

3. Stuff a rag wad into each end of pipe and lightly tamp using a flat
end stick.

4. Insert stones and/or scrap metal into each end of pipe. Be sure
the same weight of material is used in each side.
5. Insert a rag wad into each end of the pipe and pack tightly as before.

HOW TO USE:

1. Place scrap mine in a tree or pointed in the path of the enemy. Attach igniter lead to the firing circuit. The recoilless launcher is now ready to fire.

2. If safety or improvised fuse is used instead of the detonator, place the fuse into the packaged propellant through a hole drilled in the center of the pipe. Light free end of fuse when ready to fire. Allow for normal delay time.

CAUTION: Scrap will be ejected from both ends of the launcher.

MATERIAL REQUIRED:

Grenade (Improvised pipe hand grenade. Section II. No. 1. may be used) 12 gauge shotgun
12 gauge shotgun cartridges
Two washers (brass, steel, iron, etc.), having outside diameter of 5/8 in. (1-1/2 cm)
Rubber disk 3/4 in. (2 cm) in diameter and 1/4 in. (6 mm) thick (leather, neoprene, etc. can be used)
A 30 in. (76 cm) long piece of hard wood (maple, oak, etc.) approximately 5/8 in. (1-1/2 cm) in diameter. Be sure that wood will slide into barrel easily.
Gun can (grenade and its safety lever must fit into can)
Two wooden blocks about 2 in. (5 cm) square and 1-1/2 in. (4 cm) thick
One wood screw about 1 in. (2-1/2 cm) long
Two nails about 2 in. (5 cm) long
12 gauge wads, t-shirt paper, or cotton
Adhesive tape, string, or wire
Drill

PROCEDURE:

1. Punch hole in center of rubber disk large enough for screw to pass through.

2. Make push-rod as shown.

NOTE: Gun barrel is slightly less than 3/4 inch in diameter. If rubber disk does not fit in barrel, file or trim it very slightly. It should fit tightly.

3. Drill a hole through the center of one wooden block of such size that the push-rod will fit tightly. Whittle a depression around the hole on one side approximately 1/8 in. (3 mm) and large enough for the grenade to rest in.

4. Place the base of the grenade in the depression in the wooden block. Securely fasten grenade to block by wrapping tape (or wire) around entire grenade and block.

NOTE: Be sure that the tape (or wire) does not cover hole in block or interfere with the operation of the grenade safety lever.

5. Drill hole through the center of the second wooden block, so that it will just slide over the outside of the gun barrel.

6. Drill a hole in the center of the bottom of the tin can the same size as the hole in the block.

7. Attach can to block as shown.

NOTE: Gun barrel is slightly less than 3/4 inch in diameter. If rubber disk does not fit in barrel, file or trim it very slightly. It should fit tightly.

8. Slide the can and block onto the barrel until muzzle passes can open end. Wrap a small piece of tape around the barrel an inch or two from the end. Tightly wrapped string may be used instead of tape. Force the can and wooden block forward against the tape so that they are securely held in place. Wrap tape around the barrel behind the can. Wrap tape around the barrel behind the can.

CAUTION: Be sure that the can is securely fastened to the gun barrel. If the can should become loose, it will slide down the barrel after the launcher is assembled, the grenade will explode after the regular delay time.

9. Remove crimp from a 12 gauge shotgun cartridge with penknife. Open cartridge. Pour shot from shell. Remove wads and plastic liner if present.

10. Empty the propellant onto a piece of paper. Using a knife, divide the propellant in half. Replace half of the propellant into the cartridge case.

11. Replace the 12 gauge cardboard wads into cartridge case.
NOTE: If wads are not available, stuff tissue paper or cotton into the cartridge case. Pack tightly.

HOW TO USE:

Method I - When ordinary grenade is used:

1. Load cartridge in gun.
2. Push end of push-rod without the rubber disk into hole in wooden block fastened to grenade.
3. Slowly push rod into barrel until it rests against the cartridge case and grenade is in can. If the grenade is not in the can, remove rod and cut to proper size. Push rod back into barrel.

4. With can holding safety lever of grenade in place, carefully remove safety pin.

CAUTION: Be sure that the sides of the can restrain the grenade safety lever. If the safety lever should be released for any reason, grenade will explode after regular grenade delay time.

5. To fire grenade launcher, rest gun in ground at angle determined by range desired. A 45 degree angle should give about 150 meters (160 yds.)

Method II - When improvised pipe grenade is used:

An improvised pipe grenade (Section II, No. 1) may be launched in a similar manner. No tin can is needed.

1. Fasten the grenade to the block as shown above with the fuse hole at the end opposite the block.
2. Push end of push-rod into hole in wooden block fastened to grenade.
3. Push rod into barrel until it rests against cartridge case.
4. Load cartridge in gun.
5. Follow step 5 of Method I.
6. Using a fuse with at least a 10 second delay, light the fuse before firing.
7. Fire when the fuse burns to 1/2 its original length.

MATERIAL REQUIRED:

Heavy cardboard container with inside diameter of 2-1/2 to 3 in. (6.3 to 7.6 cm) and at least 32 in. (80 cm) long (ammunition container is suitable)

Black powder = 4 grams (1/8 ounce) or less

Safety or improvised fuse (Section VI, No. 7)

Grenade (improved hand grenade, Section II, No. 1) may be used

Rag, approximately 20 in. x 24 in. (50 cm x 60 cm)

Paper

CAUTION: 4 grams of black powder yield the maximum range. Do not use more than this amount. See Improvised Scale, Section VII, No. 8, for measuring.

PROCEDURE: METHOD I - If Standard Grenade is Used.

1. Discard top of container. Make small hole in bottom.

2. Place black powder in paper. Tie end with string so contents cannot fall out. Place package in container.

3. Insert rag wadding into container. Pack tightly with CAUTION.

4. Measure off a length of fuse that will give the desired delay. Thread this through hole in bottom of container so that it penetrates into the black powder package.

NOTE: If improvised fuse is used, be sure fuse fits loosely through hole in bottom of container.

5. Hold grenade safety lever and carefully withdraw safety pin from grenade. Insert grenade into container, lever end first.

CAUTION: If grenade safety lever should be released for any reason, grenade will explode after normal delay time.

6. Bury container about 6 in. (15 cm) in the ground at 30' angle, bringing fuse up alongside container. Pack ground tightly around container.
CAUTION: The tightly packed dirt helps to hold the tube together during the firing. Do not fire unless at least the bottom half of the container is buried in solidly packed dirt.

**METHOD II - IF IMPROVISED PIPE HAND GRENADE IS USED**

1. Follow step 1 of above procedure.

2. Measure off a piece of fuse at least as long as the cardboard container. Tape one end of this to the fuse from the blasting cap in the improvised grenade. Be sure ends of fuse are in contact with each other.

3. Place free end of fuse and black powder on piece of paper. Tie ends with string so contents will not fall out.

5. Insert fuse through hole in end of cardboard container. Be sure it goes into black powder package.

NOTE: Cardboard container may be used for only one firing.

6. Follow step 6 of Method I.

**HOW TO USE:**

Light fuse when ready to fire.

**SECTION IV**

**73**

**NO. 4**

**FIRE BOTTLE LAUNCHER**

A device using 2 items (shotgun and chemical fire bottle) that can be used to start or place a fire 60 yards (72 meters) from launcher.

**MATERIAL REQUIRED:**

- Standard 12 gauge or improvised shotgun (Section III, No. 3)
- Improvised fire bottle (Section V, No. 1)

**IMPROVISED MUNITIONS**

- Tin can, about 4 in. (10 cm) in diameter and 5-1/2 in. (14 cm) high
- Wood, about 3 in. x 3 in. x 2 in. (7-1/2 cm x 7-1/2 cm x 5 cm)
- Nail, at least 3 in. (7-1/2 cm) long
- Nuts and bolts or nails, at least 2-1/2 in. (6-1/2 cm) long
- Rag
- Paper
- Drill

**If Standard Shotgun is Used:**

- Hard wood stick, about the same length as shotgun barrel and about 5-1/2 in. (1-1/2 cm) in diameter. Stick need not be round.
- 2 washers (brass, steel, iron, etc.) having outside diameter of 5/8 in. (1-1/4 cm)
- One wood screw about 1 in. (2-1/4 cm) long
- Rubber disk, 3/4 in. (2 cm) in diameter and 1/4 in. (6 mm) thick, leather, cardboard, etc. can be used.
- 12 gauge shotgun ammunition

**If Improvised Shotgun is Used:**

- Fuse, safety or improvised fast burning (Section VI, No. 7)
- Hard wood stick, about the same length as shotgun barrel and 3 in. (7-1/2 cm) in diameter

**PROCEDURE:**

**METHOD I - IF IMPROVISED SHOTGUN IS USED:*

1. Drill hole in center of wood block approximately 1 in. (2-1/8 cm) deep. Hole should have approximately the same diameter as the wooden stick.

2. Drill 2 small holes on opposite sides of the wooden block. Hole should be large enough for bolts to pass through.

3. Fasten can to block with nuts and bolts.

NOTE: Can may also be securely fastened to block by hammering several nails through can and block. Do not drill holes, and be careful not to split wood.

4. Place wooden stick into hole in wooden block. Drill small hole (same diameter as that of 3 in. nail) through wooden block and through wooden stick. Insert nail in hole.

5. Crumple paper and place in bottom of can. Place another piece of paper around fire bottle and insert in can. Use enough paper so that bottle will fit snugly.
6. Place safety fuse and black powder on paper. Tie each end with string.

7. Thread fuse through hole in plug. Place powder package in rear of shotgun. Screw plug finger tight into coupling.

NOTE: Hole in plug may have to be enlarged for fuse.

Pipe Plug
Safety Fuse
Black Powder

76

8. Insert rag into front of shotgun. Pack rag against powder package with stick. USE CAUTION.

METHOD II - If Standard Shotgun is Used:

1. Follow Steps 1 and 2, Shotgun Grenade Launcher, Section IV, No. 2.

2. Follow procedure of Method I, Steps 1 - 5.

3. Follow Steps 9, 10, 11, Shotgun Grenade Launcher, Section IV, No. 2, using 1/3 of total propellant instead of 1/2.

4. Load cartridge in gun.

HOW TO USE:

1. Insert stick and holder containing chemical fire bottle.

CAUTION: Do not tilt muzzle downward.

Safety Fuse
Pipe Plug

2. Hold gun against ground at 45° angle and light fuse.

NOTE: Steps 1 and 2, "HOW TO USE," same for both standard and improvised shotguns.

CAUTION: Severe burns may result if bottle shatters when fired. If possible, obtain a bottle identical to that being used as the fire bottle. Fill about 2/3 full of water and fire as above. If bottle shatters when fired instead of being launched intact, use a different type of bottle.

Section IV
No. 5
GRENADE LAUNCHERS

A variety of grenade launchers can be fabricated from metal pipes and fittings. Flanges up to 600 meters (660 yards) can be obtained depending on length of tube, charge, number of grenades, and angle of firing.

MATERIAL REQUIRED:

Metal pipe, threaded on one end and approximately 2-1/2 in. (6-1/4 cm) in diameter and 14 in. to 4 ft. (35 cm to 119 cm) long depending on range desired and number of grenades used.

End cap to fit pipe
Black powder, 13 to 50 gm, approximately 1-1/4 to 4-1/4 tablespoons (Section I, No. 3)
Safety fuse, fast burning improvised fuse (Section VI, No. 7) or improvised electric bulb initiator (Section VI, No. 1 Automobile light bulb is needed)
Grenade(s) - 1 to 8
Rag(s) - about 30 in. x 30 in. (75 cm x 75 cm) and 20 in. x 20 in. (55 cm x 55 cm)

Drill String

NOTE: Examine pipe carefully to be sure there are no cracks or other flaws.

PROCEDURE:

METHOD I - If Fuse is Used:

1. Drill small hole through center of end cap.

2. Make small knot near one end of fuse. Place black powder and knotted end of fuse in paper and tie with string.

3. Thread fuse through hole in end cap and place package in end cap. Screw end cap onto pipe, being careful that black powder package is not caught between the threads.

4. Roll rag so that it is about 6 in. (15 cm) long and has approximately the same diameter as the pipe. Push rolled rag into open end of pipe until it rests against black powder package.

5. Hold grenade safety lever in place and carefully withdraw safety pin.
CAUTION: If grenade safety lever is released for any reason, grenade will explode after regular time. (4 - 5 sec.)

6. Holding safety lever in place, carefully push grenade into pipe, lever end first, until it rests against rag wash.

7. The following table lists various types of grenade launchers and their performance characteristics.

<table>
<thead>
<tr>
<th>Desired Range</th>
<th>No. of Grenades Launched</th>
<th>Black Powder Charge</th>
<th>Pipe Length</th>
<th>Firing Angle</th>
</tr>
</thead>

<td>25 gm</td>
<td>48&quot;</td>
<td>30'</td>
</tr>
</tbody>
</table>

(a) For this range, an additional delay is required. See Section VI, No. 11 and 12.
(b) For multiple grenade launcher, load as shown.

NOTE: Since performance of different black powder varies, fire several test rounds to determine the exact amount of powder necessary to achieve the desired range.

2. Light fuse when ready to fire.

METHOD II - If Electrical Igniter is Used:

NOTE: Be sure that bulb is in good operating condition.

1. Prepare electric bulb igniter as described in Section VI, No. 1.

2. Place electric igniter and black powder charge in paper. Tie ends of paper with string.

3. Follow above Procedure, Steps 3 to end.

HOW TO USE:

1. Follow above How to Use, Step 1.

2. Connect leads to firing circuit. Close circuit when ready to fire.

Section IV

60 mm MORTAR PROJECTILE LAUNCHER

A device to launch 60 mm mortar rounds using a metal pipe 2-1/2 in. (6 cm) in diameter and 4 ft. (120 cm) long as the launching tube.

MATERIAL REQUIRED:

Mortar, projectile (60 mm) and charge increments
Metal pipe 2-1/2 in. (6 cm) in diameter and 4 ft. (120 cm) long, threaded on one end
Threaded end cap to fit pipe
Bolt, 1/8 in. (3 mm) in diameter and at least 1 in. (2-1/2 cm) long
Two (2) nuts to fit bolt
Pipe Drill

PROCEDURE:

1. Drill hole 1/8 in. (3 mm) in diameter through center of end cap.

2. Round off end of bolt with file.

3. Place bolt through hole in end cap. Secure in place with nuts as illustrated.

4. Screw end cap onto pipe tightly. Tube is now ready for use.
HOW TO USE:

1. Bury launching tube in ground at desired angle so that bottom of tube is at least 2 ft. (60 cm) underground. Adjust the number of increments in rear finned end of mortar projectile. See following table for launching angle and number of increments used.

2. When ready to fire, withdraw safety wire from mortar projectile. Drop projectile into launching tube, FINNED END FIRST.

CAUTION: Be sure bore riding pin is in place in fuse when mortar projectile is dropped into tube. A live mortar round would explode in the tube if the fit is loose enough to permit the bore riding pin to come out part way.

CAUTION: The round will fire as soon as the projectile is dropped into tube. Keep all parts of body behind the open end of the tube.

MATERIALS REQUIRED How Used Common Source
Sulphuric Acid Storage Batteries Motor Vehicles
Gasoline Motor Fuel Gas Station or
Potassium Chlorate Medicine Sweetening Foods Drug Store
Sugar Food Store
Glass bottle with stopper (roughly 1 quart size).
Small Bottle or jar with lid.
Rag or absorbent paper (paper towels, newspaper).
String or rubber bands.

PROCEDURE

1. Sulphuric Acid Must be Concentrated. If battery acid or other dilute acid is used, concentrate it by boiling until dense white fumes are given off. Container used should be of enamelled or oven glass.

CAUTION

Sulphuric acid will burn skin and destroy clothing. If any is spilled, wash it away with a large quantity of water. Fumes are also dangerous and should not be inhaled.

2. Remove the acid from heat and allow to cool to room temperature.

3. Pour gasoline into the large (1 quart) bottle until it is approximately 2/3 full.

4. Add concentrated sulphuric acid to gasoline slowly until the bottle is filled to within 1" to 2" from top. Place the stopper on the bottle.

5. Wash the outside of the bottle thoroughly with clear water.

CAUTION

If this is not done, the fire bottle may be dangerous to handle once used.

6. Wrap a clean cloth or several sheets of absorbent paper around the outside of the bottle. Tie with string or fasten with rubber bands.

7. Dissolve 1/2 cup (100 gm) of potassium chloride and 1/2 cup (100 gm) of sugar in one cup (250 cc) of boiling water.

CAUTION

Store this bottle separately from the other bottle.
HOW TO USE

1. Shake the small bottle to mix contents and pour onto the cloth or paper around the large bottle.

Bottle can be used wet or after solution has dried. However, when dry, the sugar - Potassium chlorate mixture is very sensitive to spark or flame and should be handled accordingly.

2. Throw or launch the bottle. When the bottle breaks against a hard surface (target) the fuel will ignite.

Use With Molotov Cocktail

Tape the "match end tab" of the igniter to the neck of the molotov cocktail.

Grasp the "cover end tab" and pull sharply or quickly to ignite.

General Use

The book match igniter can be used by itself to ignite flammable liquids, fuse cords and similar items requiring hot ignition.

CAUTION

Store matches and completed igniters in moistureproof containers such as rubber or plastic bags until ready for use. Damp or wet paper book matches will not ignite.

Section V

86 No. 2
IGNITER FROM BOOK MATCHES

This is a hot igniter made from paper book matches for use with molotov cocktail and other incendiaries.

Material Required

Paper book matches,
Adhesive or friction tape.

Procedure

1. Remove the staple(s) from match book and separate matches from cover.

2. Fold and tape one row of matches.

3. Shape the cover into a tube with striking surface on the inside and tape. Make sure the folded cover will fit tightly around the taped match heads. Leave cover open at opposite end for insertion of the matches.

4. Push the taped matches into the tube until the bottom ends are exposed about 3/4 in. (2 cm).

5. Flatten and fold the open end of the tube so that it laps over about 1 in. (2 1/2 cm); tape in place.

87
3. Punch 2 small holes just below the rim of the open end of the can.

4. Tape blue tip matches together in pairs. The distance between the match heads should equal the inside diameter of the can. Two pairs are sufficient.

5. Attach paired matches to second and third coils of the spring, using thin wire.

6. Insert the end of the spring opposite the matches into the tin can.

7. Compress the spring until the end with the matches passes the slot in the can. Pass the flat stick or piece of metal through slots in can to hold spring in place. This acts as a safety device.

8. Punch many closely spaced small holes between the lines marked on the can to form a striking surface for the matches. Be careful not to seriously deform can.

9. Fill the jar with gasoline and cap tightly.

10. Turn can over and place over the jar so that the safety stick rests on the lid of the jar.

11. Pass wire or twine around the bottom of the jar. Thread ends through holes in can and bind tightly to jar.

12. Tape wire or cord to jar near the bottom.

HOW TO USE

1. Carefully withdraw flat safety stick.

2. Throw jar at hard surface.

CAUTION:

DO NOT REMOVE SAFETY STICK UNTIL READY TO THROW FIRE BOTTLE.

The safety stick, when in place, prevents ignition of the fire bottle if it should accidentally be broken.

Section V
No. 4
GELLED FLAME FUELS

Gelled or paste type fuels are often preferable to raw gasoline for use in incendiary devices such as fire bottles. This type fuel adheres more readily to the target and produces greater heat concentration.

Several methods are shown for gelling gasoline using commonly available materials. The methods are divided into the following categories based on the major ingredient:

4.1 Lye Systems
4.2 Lye-Alcohol Systems
4.3 Soap-Alcohol Systems
4.4 Egg White Systems
4.5 Latex Systems
4.6 Wax Systems
4.7 Animal Blood Systems
309

IMPROVISED MUNITIONS

93 Section V
No. 4.1
GELLED FLAME FUELS
LYE SYSTEMS

Lye (also known as caustic soda
or Sodium Hydroxide) can be used in combination with
powdered rosin or castor oil to gel gasoline line for use as a
flame fuel which will adhere to target surfaces.

NOTE: This fuel is not suitable for use in the chemical
(Sulphuric Acid) type of fire bottle (Section V, No. 1).
The acid will react with the lye and break down the gel.

MATERIALS REQUIRED:

<table>
<thead>
<tr>
<th>Parts by</th>
<th>Ingredient</th>
<th>How Used</th>
<th>Common Source</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>Castor Oil</td>
<td>Medicine</td>
<td>Food and Drug Stores</td>
</tr>
</tbody>
</table>

PROCEDURE:

CAUTION: Make sure that there are no open flames when mixing flame fuels. NO SMOKING!

1. Pour gasoline into jar, bottle or other container. (DO NOT USE AN ALUMINUM CONTAINER.)
2. If rosin is in cake form, crush into small pieces.
3. Add rosin or castor oil to the gasoline and stir for about five (5) minutes to mix thoroughly.
4. In a second container (NOT ALUMINUM) add lye to an equal volume of water slowly with stirring.

CAUTION: Lye solution can burn skin and destroy clothing. If any is spilled, wash away immediately with large quantities of water.

5. Add lye solution to the gasoline mix and stir until mixture thickens (about one minute).

NOTE: The sample will eventually thicken to a very firm paste. This can be thinned, if desired, by stirring in additional gasoline.

94 Section V
No. 4.2
GELLED FLAME FUELS
LYE-ALCOHOL SYSTEMS

Lye (also known as caustic soda or Sodium Hydroxide) can be used in combination with alcohol and any of several fats to gel gasoline for use as a flame fuel.

NOTE: This fuel is not suitable for use in the chemical (Sulphuric Acid) type of fire bottle (Section V, No. 1). The acid will react with the lye and break down the gel.

MATERIALS REQUIRED:

<table>
<thead>
<tr>
<th>Parts by</th>

<td>Liquor store, Drug store</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE: Methyl (wood) or isopropyl (rubbing) alcohols can be substituted for the whiskey.

PROCEDURE:

CAUTION: Make sure that there are no open flames when mixing flame fuels. NO SMOKING!

1. Pour gasoline into bottle, jar or other container. (DO NOT USE AN ALUMINUM CONTAINER).
2. Add Tallow or substitute to the gasoline and stir for about 1/2 minute to dissolve fat. 95
3. Add alcohol to the gasoline mixture.
4. In a separate container (NOT ALUMINUM) slowly add lye to an equal amount of water. Mixture should be stirred constantly while adding lye.

CAUTION: Lye solution can burn skin and destroy clothing. If any is spilled, wash away immediately with large quantities of water.

5. Add lye solution to the gasoline mixture and stir occasionally until thickened (about 1/2 hour).

NOTE: The mixture will eventually (1 to 2 days) thicken to a very firm paste. This can be thinned, if desired, by stirring in additional gasoline.

90 Section V
No. 4.1
GELLED FLAME FUELS
SOAP-ALCOHOL SYSTEM

Common household soap can be used in combination with alcohol to gel gasoline for use as a flame fuel which will adhere to target surfaces.

MATERIALS REQUIRED:

<table>
<thead>
<tr>
<th>Parts by</th>
<th>Ingredient</th>
<th>How Used</th>
<th>Common Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume</td>
<td></td>
<td></td>
<td></td>

<td>Laundry soap</td>
<td>Washing clothes</td>
<td>Stores</td>
</tr>
<tr>
<td>28 (flake)</td>
<td></td>
<td>Drug store</td>
<td></td>
</tr>
</tbody>
</table>

NOTE: Unless the word "soap" actually appears somewhere on the container or wrapper, a washing compound is probably a detergent. These Can Not Be Used.

PROCEDURE:

CAUTION: Make sure that there are no open flames in the area when mixing flame fuels. NO SMOKING!

1. Pour gasoline into bottle, jar or other container. (DO NOT USE AN ALUMINUM CONTAINER).
2. Add Tallow (or substitute) to the gasoline and stir for about 1/2 minute to dissolve fat.
3. Add alcohol to the gasoline mixture.
4. In a separate container (NOT ALUMINUM) slowly add lye to an equal amount of water. Mixture should be stirred constantly while adding lye.

CAUTION: Lye solution can burn skin and destroy clothing. If any is spilled, wash away immediately with large quantities of water.

5. Add lye solution to the gasoline mixture and stir occasionally until thickened (about 1/2 hour).

NOTE: The mixture will eventually (1 to 2 days) thicken to a very firm paste. This can be thinned, if desired, by stirring in additional gasoline.
EGG SYSTEMS

The white of any bird egg can be used to gel gasoline for use as a flame fuel which will adhere to target surfaces.

PROCEDURE:

1. Separate egg white from yolk. This can be done by breaking the egg into a dish and carefully removing the yolk with a spoon.

NOTE: DO NOT GET THE YELLOW EGG YOLK MIXED INTO THE EGG WHITE. If egg yolk gets into the egg white, discard the egg.

LATEX SYSTEMS

Any milky white plant fluid is a potential source of latex which can be used to gel gasoline.

MATERIALS REQUIRED:

<table>
<thead>
<tr>

<td></td>
<td>Petroleum wells</td>
</tr>
</tbody>
</table>

NOTE: If acids are not available, use acid salt (alum, sulfates and chlorides other than sodium or potassium). The formic acid from crushed red ants can also be used.

PROCEDURE:

CAUTION: Make sure that there are no open flames in the area when mixing flame fuels. NO SMOKING!

1. With Commercial Rubber Latex:
   a. Place 7 parts by volume of latex and 92 parts by volume of gasoline in bottle. Cap bottle and shake to mix well.
   b. Add 1 part by volume of vinegar (or other acid) and shake until gel forms.

CAUTION: Concentrated acids will burn skin and destroy clothing. If any is spilled, wash away immediately with large quantities of water.

2. With Natural Latex:
   a. Natural latex should form lumps as it comes from the plant. If lumps do not form, add a small amount of acid to the latex.
   b. Strain off the latex lumps and allow to dry in air.
   c. Place 20 parts by volume of latex in bottle and add 80 parts by volume of gasoline. Cover bottle and allow to stand until a swollen gel mass is obtained (2 to 3 days).

WAX SYSTEMS

Any of several common waxes can be used to gel gasoline for use as a flame fuel which will adhere to target surfaces.
MATERIALS REQUIRED:

<table>
<thead>
<tr>

<td>Motor vehicles</td>
</tr>
</tbody>
</table>

Any one of the following:

| 2               | Salt        | Common Source          |
|                 |             | Ground Coffee          |

Any one of the following:

| 20              | Ozocerite   | Leather polish        |
|                 | Mineral wax| Sealing wax           |
|                 | Fossil wax | Candles               |
|                 | Ceresin wax| Crayons               |
|                 | Beeswax    | Wax Paper             |
|                 | Bayberry wax| Furniture and floor waxes |
|                 | Mystile wax| Honeycomb of bees     |

PROCEDURE:

1. Obtaining wax from Natural Sources: 
   Plants and berries are potential sources of natural waxes. Place the plants and/or berries in boiling water. The natural waxes will melt. Let the water cool. The natural waxes will form a solid layer on the water surface. Skim off the solid wax and let it dry. With natural waxes which have suspended matter when melted, screen the wax through a cloth.

2. Melt the wax and pour into jar or bottle which has been placed in a hot water bath.

3. Add gasoline to the bottle.

4. When wax has completely dissolved in the gasoline, allow the water bath to cool slowly to room temperature.

NOTE: If a gel does not form, add additional wax (up to 40% by volume) and repeat the above steps. If no gel forms with 40% wax, make a Lye solution by dissolving a small amount of Lye (Sodium Hydroxide) in an equal amount of water. Add this solution (1/2% by volume) to the gasoline wax mix and shake bottle until a gel forms.

102

GELLED FLAME FUELS

ANIMAL BLOOD SYSTEMS

Animal blood can be used to gel gasoline for use as a flame fuel which will adhere to target surfaces.

MATERIAL REQUIRED:

<table>
<thead>
<tr>
<th>Parts by Volume</th>
<th>Ingredient</th>
<th>How Used</th>
<th>Common Source</th>
</tr>
</thead>

</tbody>
</table>

Any one of the following:

| 30              | Animal blood Serum | Food | Medicine | Slaughter House |
|                 |                    |      |          | Natural habitat |

Any one of the following:

| 2               | Salt        | Food | Industrial processes | Sea Water |
|                 |             |     |                      | Natural brine |

Any one of the following:

| 20              | Ozocerite   | Food | Industrial processes | Sea Water |
|                 | Mineral wax|     |                      | Natural brine |

PROCEDURE:

1. Preparation of animal blood serum:
   a. Slit animal’s throat by jugular vein. Hang up-side down to drain.
   b. Place coagulated (lumpy) blood in a cloth or on a screen and catch the red fluid (serum) which drains through.
   c. Store in cool place if possible.

CAUTION: Do not get aged animal blood or the serum into an open cut. This can cause infections.

2. Pour blood serum into jar, bottle, or other container and add gasoline.

3. Add the salt (or other additive) to the mixture and stir until a gel forms.

103

ACID DELAY INCENDIARY

This device will ignite automatically after a given time delay.

MATERIAL REQUIRED:

| Small jar with cap |
| Cardboard |
| Adhesive tape |
| Potassium Chlorate |
| Sulphuric Acid (Battery Acid) |
| Rubber sheeting (automotive inner tube) |
**PROCEUDRE:**

1. Sulphuric acid must be concentrated. If battery acid or other dilute acid is used, concentrate it by boiling. Container used should be of enameware or oven glass. When dense white fumes begin to appear, immediately remove the acid from heat and allow to cool to room temperature.

**CAUTION:** Sulphuric acid will burn skin and destroy clothing. If any is spilled, wash it away with a large quantity of water. Fumes are also dangerous and should not be inhaled.

2. Dissolve one part by volume of Potassium Chlorate and one part by volume of sugar in two parts by volume of boiling water.

3. Allow the solution to cool. When crystals settle, pour off and discard the liquid.

4. Form a tube from cardboard just large enough to fit around the outside of the jar and 2 to 3 times the height of the jar. Tape one end of the tube closed.

5. Pour wet Potassium Chlorate-sugar crystals into the tube until it is about 2/3 full. Stand the tube aside to dry.

6. Drill a hole through the cap of the jar about 1/2 inch (1.1/4 cm) in diameter.

7. Cut a disc from rubber sheet so that it just fits snugly inside the lid of the jar.

8. Partly filljar with water, cover with rubber disc and cap tightly with the drilled lid. Invert bottle and allow to stand for a few minutes to make sure that there are no leaks. **THIS IS EXTREMELY IMPORTANT.**

9. Pour water from jar and fill about 1/3 full with concentrated sulphuric acid. Replace the rubber disc and cap tightly.

**IMPORTANT:** Wash outside of jar thoroughly with clear water. If this is not done, the jar may be dangerous to handle during use.

**HOW TO USE:**

1. Place the tube containing the Sugar Chlorate crystals on an incendiary or flammable material taped end down

2. Turn the jar of sulphuric acid cap end down and slide it into the open end of the tube.

**JAR WITH SULPHURIC ACID**

**TUBE OF SUGAR CHLORATE**

**INCENDIARY OR FLAMMABLE MATERIAL**

After a time delay, the acid will eat through the rubber disc and ignite the sugar chlorate mix. The delay time depends upon the thickness and type of rubber used for the disc. Before using this device, tests should be conducted to determine the delay time that can be expected.

**NOTE:** A piece of standard automobile inner tube (about 1/32" thick) will provide a delay time of approximately 45 minutes.

---

**SECTION VI
No. 1**

**ELECTRIC BULB INITIATOR**

Mortars, mines and similar weapons often make use of electric initiators. An electric initiator can be made using a flashlight or automobile electric light bulb.

**MATERIAL REQUIRED**

- Bulb Base
- Filament
- Electric light bulb and matching socket
- Cardboard or heavy paper
- Black Powder
- Adhesive tape
- Cardboard Tube Cap or Tape

**PROCEDURE**

**Method I**

1. Break the glass of the electric light bulb. Take care not to damage the filament. The initiator will NOT work if the filament is broken. Remove all glass above the base of the bulb.

2. Form a tube 3 to 4 inches long from cardboard or heavy paper to fit around the base of the bulb. Join the tube with adhesive tape.
3. Fit the tube to the bulb base and tape in place.

Make sure that the tube does not cover that portion of the bulb base that fits into the socket.

4. If no socket is available for connecting the initiator to the firing circuit, solder the connecting wires to the bulb base.

CAUTION: Do NOT use a hot soldering iron on the completed device since it may ignite the

Material Required

- Paper book matches
- Adhesive or friction tape
- Fuse cord (improvised or commercial)
- Pin or small nail

Procedure

1. Remove the staple(s) from match book and separate matches from cover.
8. Push pin or small nail through matches and fuse cord. Bend end of pin or nail.

Method of Use

To light the fuse cord, the igniter is held by both hands and pulled sharply or quickly.

CAUTION

Store matches and completed fuse igniters in moistureproof containers such as plastic or rubber type bags until ready for use. Damp or wet paper book matches will not ignite. Fuse lengths should not exceed 12 in. (30 cm) for easy storage. These can be spliced to main fuses when needed.

Section VI

110 No. 1
DELAY IGNITER FROM CIGARETTE

A simple and economical time delay can be made with a common cigarette.

Materials Required

Cigarette.
Paper match.
String (shoelace or similar cord).
Fuse cord (improvised or commercial).

Procedure

1. Cut end of fuse cord to expose inner core.

2. Light cigarette in normal fashion. Place a paper match so that the head is over exposed end of fuse cord and screw can be tightly threaded through it.

3. Position the burning cigarette with fuse so that it burns freely. A suggested method is to hang the delay on a twig.

NOTE

Common dry cigarettes burn about 1 inch every 7 or 8 minutes in still air. If the fuse cord is placed 1 inch from the burning end of a cigarette a time delay of 7 or 8 minutes will result.

Delay time will vary depending upon type of cigarette, wind, moisture, and other atmospheric conditions.

To obtain accurate delay time, a test run should be made under "use" conditions.

Section VI

112 No. 4
WATCH DELAY TIMER

A time delay device for use with electrical firing circuits can be made by using a watch with a plastic crystal.

Material and Equipment Required

Watch with plastic crystal.
Small clean metal screw.
Battery.
Connecting wires.
Drill or nail.

Procedure

1. If watch has a sweep or large second hand, remove it. If delay time of more than one hour is required, also remove the minute hand. If hands are painted, carefully scrape paint from contact edge with knife.

2. Drill a hole through the crystal of the watch or pierce the crystal with a heated nail. The hole must be small enough that the match head can be inserted into it.
3. Place the screw in the hole and turn down as far as possible without making contact with the face of the watch. If screw has a pointed tip, it may be necessary to grind the tip flat.

If no screw is available, pass a bent stiff wire through the hole and tape to the crystal.

**IMPORTANT:** Check to make sure hand of watch cannot pass screw or wire without contacting it.

**How to Use**

1. Set the watch so that a hand will reach the screw or wire at the time you want the firing circuit completed.

2. Wind the watch.

3. Attach a wire from the case of the watch to one terminal of the battery.

4. Attach one wire from an electric initiator (blasting cap, squib, or alarm device) to the screw or wire on the face of the watch.

5. After thorough inspection is made to assure that the screw or the wire connected to it is not touching the face or case of the watch, attach the other wire from the initiator to the second terminal of the battery.

**CAUTION**

Follow step 5 carefully to prevent premature initiation.

---

**Section VI No. 5**

**NO-FLASH FUSE IGNITER**

A simple no-flash fuse igniter can be made from common pipe fittings.

**MATERIAL REQUIRED:**

- ¼ in. (6mm) Pipe Cap
- Solid ¼ in. (6mm) Pipe Plug
- Flat head nail about 1½ in. (1 1/2 mm) in diameter
- Hand Drill
- Common "Strike Anywhere" Matches
- Adhesive Tape

**PROCEDURE:**

1. Screw the pipe plug tightly into the pipe cap.

---

**Section VI No. 6**

**DRIED SEED TIMER**

A time delay device for electrical firing circuits can be made using the principle of expansion of dried seeds.

**MATERIAL REQUIRED:**

Dried peas, beans or other dehydrated seeds
**Wide mouth glass jar with non-metal cap**
- Two screws or bolts
- Thin metal plate
- Hand drill
- Screwdriver

**PROCEDURE:**

1. Determine the rate of rise of the dried seeds selected. This is necessary to determine delay time of the timer.
   - a. Place a sample of the dried seeds in the jar and cover with water.
   - b. Measure the time it takes for the seeds to rise a given height. Most dried seeds increase 50% in one to two hours.

2. Cut a disc from thin metal plate. Disc should fit loosely inside the jar.

**NOTE:** If metal is painted, rusty or otherwise coated, it must be scraped or sanded to obtain a clean metal surface.

3. Drill two holes in the cap of the jar about 2 inches apart. Diameter of holes should be such that screws or bolts will thread tightly into them. If the jar has a metal cap or no cap, a piece of wood or plastic (NOT METAL) can be used as a cover.

4. Turn the two screws or bolts through the holes in the cap. Bolts should extend about 1 inch (2.5 cm) into the jar.

**IMPORTANT:** Both bolts must extend the same distance below the container cover.

5. Pour dried seeds into the container. The level will depend upon the previously measured rise time and the desired delay.

6. Place the metal disc in the jar on top of the seeds.

**HOW TO USE:**

1. Add just enough water to completely cover the seeds and place the cap on the jar.
2. Attach connecting wires from the firing circuit to the two screws on the cap.

**Expansion of the seeds will raise the metal disc until it contacts the screws and closes the circuit.**

**BATTERY**
- **BLASTING CAP**

**FAST BURNING FUSE**

The burning rate of this fuse is approximately 40 in. (100 cm) per minute.

**MATERIAL REQUIRED:**
- Soft Cotton String
- Fine Black Powder
- Piece of round stick
- Two pans or dishes

**PROCEDURE:**

1. Moisten fine Black Powder to form a paste or prepare a substitute as follows:
   - a. Dissolve Potassium Nitrate in an equal amount of water.
   - b. Pulverize charcoal by spreading thinly on a hard surface and rolling the round stick over it to crush to a fine powder.
   - c. Pulverize sulphur in the same manner.
   - d. Dry mix sulphur and charcoal.
   - e. Add Potassium Nitrate solution to the dry mix to obtain a thoroughly wet paste.

3. Rub paste mixture into twisted string with fingers and allow to dry.

4. Check actual burning rate of fuse by measuring the time it takes for a known length to burn. This is used to determine the length needed for a desired delay time. If 5 in. (12 1/2 cm) burns for 6 seconds, 50 in. (125 cm) of fuse cord will be needed to obtain one minute (60 second) delay time.

**SLOW BURNING FUSE**

The burning rate of this fuse is approximately 2 in. (5 cm) per minute.

**MATERIAL REQUIRED:**
- Cotton String or 3 Shoelaces
- Potassium Nitrate or Potassium Chlorate
- Granulated Sugar
PROCEDURE:

1. Wash cotton string or shoelaces in hot soapy water; rinse in fresh water.

2. Dissolve 1 part Potassium Nitrate or Potassium Chlorate and 1 part granulated sugar in 2 parts hot water.

3. Soak string or shoelaces in solution.

4. Twist or braid three strands of string together and allow to dry.

5. Check actual burning rate of the fuse by measuring the time it takes for a known length to burn. This is used to determine the length needed for the desired delay time. If 2 in. (5 cm) burns for 1 minute, 10 in. (25 cm) will be needed to obtain a 5 minute delay.

NOTE: The last few inches of this cord (the end inserted in the material to be ignited) should be coated with the fast burning Black Powder paste if possible. This must be done when the fuse is used to ignite a blasting cap.

REMEMBER: The burning rate of either of these fuses can vary greatly. Do Not Use for ignition until you have checked their burning rate.

NOTE: The string must keep the rear end of the clothespin closed so that the jaws stay open and no contact is made between the wires.

HOW TO USE:

Suspend the entire system vertically with the cigarette tip down. Light tip of cigarette. Switch will close and initiation will occur when the cigarette burns up to and through the string.

NOTE: Wires to the firing circuit must not be pulled too tight when the switch is mounted. This could prevent the jaws from closing.

SECTION VI

No. 122

TIME DELAY GRENADE

This delay mechanism makes it possible to use an ordinary grenade as a time bomb.

MATERIAL REQUIRED:

Grenade
Fuse Cord

IMPORTANT: Fuse cord must be the type that burns completely. Fast burning improvised fuse cord (Section VI, No. 7) is suitable. Safety fuse is not satisfactory, since its outer covering does not burn.

PROCEDURE:

1. Bend end of safety lever upward to form a hook. Make a single loop of fuse cord around the center of the grenade body and safety lever. Tie a knot of the non-slip variety at the safety lever.

NOTE: The loop must be tight enough to hold the safety lever in position when the pin is removed.

2. Measuring from the knot along the free length of the fuse cord, measure off a length of fuse cord that will give the desired delay time. Cut off the excess fuse cord.
HOW TO USE:

1. Place hand around grenade and safety lever so safety lever is held in place. Carefully remove pin.

2. Emplace grenade in desired location while holding grenade and safety lever.

3. Very carefully remove hand from grenade and safety lever, making sure that the fuse cord holds the safety lever in place.

CAUTION: If loop and knot of fuse cord do not hold for any reason and the safety lever is released, the grenade will explode after the regular delay time.

4. Light free end of fuse cord. Section VI

CAN-LIQUID TIME DELAY

A time delay device for electrical firing circuits can be made using a can and liquid.

MATERIAL REQUIRED:

Can
Liquid (water, gasoline, etc.)
Small block of wood or any material that will float on the liquid used
Knife
2 pieces of solid wire, each piece 1 foot (30 cm) or longer

PROCEDURE:

1. Make 2 small holes at opposite sides of the can very close to the top.

2. Remove insulation from a long piece of wire for a distance a little greater than the diameter of the can.

3. Secure the wire in place across the top of the can by threading it through the holes and twisting in place, leaving some slack. Make loop in center or wire. Be sure a long piece of wire extends from one end of the can.

4. Wrap a piece of insulated wire around the block of wood. Scrape insulation from a small section of this wire and bend as shown so that wire contacts loop before wood touches bottom of container. Thread this wire through the loop of bare wire.

5. Make a very small hole (pinhole) in the side of the container. Fill container with a quantity of liquid corresponding to the desired delay time. Since the rate at which liquid leaves the can depends upon weather conditions, liquid used, size of hole, amount of liquid in the container, etc., determine the delay time for each individual case. Delays from a few minutes to many hours are possible. Vary time by adjusting liquid level, type of liquid (water, oil) and hole size.

HOW TO USE:

1. Fill can with liquid to the same level as during experimental run (step 5 above). Be sure that wooden block floats on liquid and that wire is free to move down as liquid leaves container.

2. Connect wires to firing circuit.

NOTE: A long term delay can be obtained by placing a volatile liquid (gasoline, ether, etc.) in the can instead of water and relying on evaporation to lower the level. Be sure that the wood will float on the liquid used. DO NOT MAKE PINHOLE IN SIDE OF CAN.

SHORT TERM TIME DELAY FOR GRENADE

A simple modification can produce delays of approximately 12 seconds for grenades when fired from Grenade Launchers (Section IV, No. 5).

MATERIAL REQUIRED:

Grenade
Nail
Knife
Pliers (may not be needed)
Safety fuse

NOTE: Any safety or improvised fuse may be used. However, since different time delays will result, determine the burning rate of the fuse first.

PROCEDURE:

1. Unscrew fuse mechanism from body of grenade and remove. Pliers may have to be used.

2. Carefully cut with knife or break off detonator at crimp and save for later use.

CAUTION: If detonator is cut or broken below the crimp, detonation may occur and severe injuries could result.

3. Remove safety pin pull ring and lever, letting striker hit the primer. Place fuse mechanism aside until delay fuse powder mix in mechanism is completely burned.
4. Remove pin, spring, and striker.

3. Remove primer from fuse mechanism by pushing nail through bottom end of primer hole and tapping with hammer.

6. Insert safety fuse through top of primer hole. Enlarge hole if necessary. The fuse should go completely through the hole.

7. Insert fuse into detonator and tape it securely to modified fuse mechanism.

NOTE: Be sure that fuse rests firmly against detonator at all times.

8. Screw modified fuse mechanism back into grenade. Grenade is now ready for use.

NOTE: If time delay is used for Improvised Grenade Launchers (Section IV, No. 5).

1. Wrap tape around safety fuse.
2. Securely tape fuse to grenade.
3. Load grenade in launcher. Grenade will explode in approximately 12 seconds after safety fuse burns up to bottom of grenade.

127

129

Section VI
No. 12

LONG TERM TIME DELAY FOR GRENADE

A simple modification can produce delays of approximately 20 seconds for grenades when fired from Grenade Launchers (Section IV, No. 5).

MATERIAL REQUIRED:

Grenade
Nail
"Strike-anywhere" matches, 6 to 8
Pliers (may not be needed)
Knife or sharp cutting edge
Piece of wood
Safety fuse

NOTE: Any safety or improvised fuse may be used. However, since different time delays will result, determine the burning rate of the fuse first.

PROCEDURE:

1. Unscrew fuse mechanism from body of grenade and remove. Pliers may have to be used.

2. Insert nail completely through safety hole (hole over primer).

3. Carefully remove safety pin pull ring and lever, and allow striker to hit nail.

CAUTION: If for any reason, striker should hit primer instead of nail, detonator will explode after (4-5 sec.) delay time.

5. Carefully remove top section of fuse mechanism from bottom section by unscrewing. Pliers may have to be used.

CAUTION: Use extreme care – sudden shock may set off detonator.
6. Fire primer by hitting nail placed against top of it. Remove fired primer (same as procedure 5 of Section VI, No. 11).

CAUTION: Do not hold assembly in your hand during above operation, as serious burns may result.

7. Scrape delay fuse powder with a sharpened stick. Loosen about 1/4 in. (6 mm) of powder in cavity.

8. Cut off tips (not whole head) of 6 "strike-anywhere" matches with sharp cutting edge. Drop them into delay fuse hole.

9. Place safety fuse in delay fuse hole so that it is flush against the match tips.

IMPORTANT: Be sure fuse remains flush against the match tips at all times.

10. Thread fuse through primer hole. Enlarge hole if necessary. Screw modified fuse mechanism back together. Screw combination back into grenade. Grenade modification is now ready for use. Light fuse when ready to use.

NOTE: If time delay is used for improvised Grenade Launchers (Section IV, No. 3).

1. Wrap tape around safety fuse.
2. Securely tape fuse to grenade.
3. Load grenade in launcher. Grenade will explode in approximately 20 seconds after safety fuse burns up to bottom of grenade.

20 Sec Burning Time from this Point

Section VII

CLOTHESPIN SWITCH

A spring type clothespin is used to make a circuit closing switch to actuate explosive charges, mines, booby traps and alarm systems.

Material Required

- Spring type clothespin.
- Solid copper wire - 1/16 in. (2 mm) in diameter.
- Strong string on wire.
- Flat piece of wood (roughly 1/8 x 1" x 2").
- Knife.

Procedure

1. Strip four in. (10 cm) of insulation from the ends of 2 solid copper wires. Scrape copper wires with pocket knife until metal is shiny.

2. Wind one scraped wire tightly on one jaw of the clothespin, and the other wire on the other jaw.

3. Make a hole in one end of the flat piece of wood using a knife, heated nail or drill. Tie strong string or wire through the hole.
5. Place flat piece of wood between jaws of the clothespin switch.

Basic Firing Circuit

\[ \text{INITIATOR} \]

\[ \text{BATTERY} \]

\[ \text{STRONG TWINE OR FISH LINE} \]

When the flat piece of wood is removed by pulling the string, the jaws of the clothespin will close completing the circuit.

**CAUTION**

Do not attach the battery until the switch and trip wire have been emplaced and examined. Be sure the flat piece of wood is separating the jaws of the switch.

A Method of Use

1. Remove the trip lever from the mousetrap using a hacksaw or file. Also remove the staple and holding wire.

2. Retract the striker of the mousetrap and attach the trip lever across the end of the wood base using the staple with which the holding wire was attached.

NOTE: If the trip lever is not made of metal, a piece of metal of approximately the same size should be used.

3. Strip one in. (2 1/2 cm) of insulation from the ends of 2 connecting wires.

4. Wrap one wire tightly around the spring loaded striker of the mousetrap.

5. Wrap the second wire around some part of the trip lever or piece of metal.

NOTE: If a soldering iron is available, solder both of the wires in place.

HOW TO USE: CONNECTING WIRES

This switch can be used in a number of ways -- one typical method is presented here.

The switch is placed inside a box which also contains the explosive and batteries. The spring loaded striker is held back by the lid of the box and when the box is opened the circuit is closed.

---

**Section VII No. 2 MOUSETRAP SWITCH**

A common mousetrap can be used to make a circuit closing switch for electrically initiated explosives, mines and booby traps.

**MATERIAL REQUIRED:**

Mousetrap
Hacksaw or File
Connecting wires

**PROCEDURE:**

1. Nail 10 in. x 8 in. metal sheet to 10 in. square piece of wood so that 1 in. of wood shows on each side of metal. Leave one of the nails sticking up about 1/4 in.

**Section VII No. 3 FLEXIBLE PLATE SWITCH**

This pressure sensitive switch is used for initiating emplaced mines and explosives.

**MATERIAL REQUIRED:**

Two flexible metal sheets
one approximately 10 in. x 8 in. (20 cm)
Piece of wood 10 in. square by 1 in. thick
Four soft wood blocks 1 in. x 1 in. x 1/4 in.
Eight flat head nails, 1 in. long
Connecting wires
Adhesive tape

**PROCEDURE:**

1. Nail 10 in. x 8 in. metal sheet to 10 in. square piece of wood so that 1 in. of wood shows on each side of metal. Leave one of the nails sticking up about 1/4 in.
2. Strip insulation from the end of one connecting wire. Wrap this end around the nail and drive the nail all the way in.

3. Place the four wood blocks on the corners of the wood base.

4. Place the 10 in. square flexible metal sheet so that it rests on the blocks in line with the wood base.

5. Drive four nails through the metal sheet and the blocks to fasten to the wood base. A second connecting wire is attached to one of the nails as in Step 2.

6. Wrap adhesive tape around the edges of the plate and wood base. This will assure that no dirt or other foreign matter will get between the plates and prevent the switch from operating.

HOW TO USE:
The switch is placed in a hole in the path of expected traffic and covered with a thin layer of dirt or other camouflaging material. The mine or other explosive device connected to the switch can be buried with the switch or emplaced elsewhere as desired.

When a vehicle passes over the switch, the two metal plates make contact closing the firing circuit.

Section VII
No. 4
METAL BALL SWITCH

This switch will close an electric circuit when it is tipped in any direction. It can be used alone for booby traps or in combination with another switch or timer as an anti-disturbance switch.

MATERIAL REQUIRED:
Metal Ball 1/2" (1 1/4 cm) diameter (see Note)
Solid copper wire 1/16" (1/4 cm) diameter
Wood block 1" (2 1/2 cm) square by 1/4" thick
Hand drill
Connecting wires
Soldering iron & solder

NOTE: If other than a 1/2" diameter ball is used, other dimensions must be changed so that the ball will rest in the center hole of the block without touching either of the wires.

PROCEDURE:
1. Drill four 1/16" holes and one 1/8" hole through the wood block as shown.

2. Form two "U" shaped pieces from 1/16" copper wire to the dimensions shown.

3. Wrap a connecting wire around one leg of each "U" at least 1/4" from the end and solder in place.

4. Place metal ball on block so that it rests in the center hole.

5. Insert the ends of the small "U" into two holes in the block. Insert large "U" into the remaining two holes.
CAUTION: Make sure that the metal ball does not touch either "U" shaped wire when the switch is standing on its base. If the ball does touch, bend wires outward slightly.

HOW TO USE:

Mount switch vertically and connect in electrical firing circuit as with any other switch. When tipped in any direction it will close the circuit.

CAUTION: Switch must be mounted vertically and not disturbed while completing connections.

Section VII
No. 5
ALTIMETER SWITCH

This switch is designed for use with explosives placed on aircraft. It will close an electrical firing circuit when an altitude of approximately 5000 ft (1-1/2 KM) is reached.

MATERIAL REQUIRED:
Jar or tin can
Thin sheet of flexible plastic or waxed paper
Thin metal sheet (cut from tin can)
Adhesive Tape
Connecting Wires

PROCEDURE:

1. Place sheet of plastic or waxed paper over the top of the can or jar and tape tightly to sides of container.

NOTE: Plastic sheet should not be stretched tight. A small depression should be left in the top.

2. Cut two contact strips from thin metal and bend to the shapes shown.

3. Strip insulation from the ends of two connecting wires. Attach one wire to each contact strip.

NOTE: If a soldering iron is available, solder wires in place.

4. Place contact strips over container so that the larger contact is above the smaller with a very small clearance between the two.

Section VII
No. 6
PULL-LOOP SWITCH

This switch will initiate explosive charges, mines, and booby traps when the trip wire is pulled.

MATERIAL REQUIRED:
2 lengths of insulated wire
Knife
Strong string or cord
Fine thread that will break easily

PROCEDURE:

1. Remove about 2 inches of insulation from one end of each length of wire. Scrape bare wire with knife until metal is shiny.

2. Make a loop out of each piece of bare wire.

3. Thread each wire through the loop of the other wire so the wires can slide along each other.

NOTE: The loops should contact each other when the two wires are pulled taut.

HOW TO USE:

1. Separate loops by about 2 inches. Tie piece of fine thread around wires near each loop. Thread should be taut enough to support loops and wire, yet fine enough that it will break under a very slight pull.
2. Fasten one wire to tree or stake and connect end to firing circuit.
3. Tie a piece of cord or string around the other piece of wire a few inches from the loop. Tie free end of cord around tree, bush, or stake. Connect the free end of the wire to the firing circuit. Initiation will occur when the tripod cord is pulled.

**CAUTION:** Be sure that the loops do not contact each other when the wires are connected to the firing circuit.

**OTHER USES:** The switch minus the fine thread may be used to activate a booby trap by such means as attaching it between the lid and a rigid portion of a box, between a door and a door jamb, and in similar manners.

**Section VII**
**No. 7**

**KNIFE SWITCH**

This device will close the firing circuit charges, mines, and booby traps when the trip wire is pulled or cut.

**MATERIAL REQUIRED:**
- Knife or hack saw blade
- 6 nails
- Sturdy wooden board
- Wire
- Strong string or light rope

**PROCEDURE:**

1. Place knife on board. Drive 2 nails into board on each side of knife handle so knife is held in place.
2. Drive one nail into board so that it touches blade of knife near the point.
3. Attach rope to knife. Place rope across path. Apply tension to rope, pulling knife blade away from nail slightly. Tie rope to tree, bush, or stake.
4. Drive another nail into board near the tip of the knife blade as shown below. Connect the two nails with a piece of conducting wire. Nail should be positioned so that it will contact the second nail when blade is pulled about 1 inch (2.5 cm) to the side.

**NOTE:** Check position of nails to knife blade. The nails should be placed so that the knife blade will contact either one when the rope is pulled or released.

**HOW TO USE:**

Attach one wire from firing circuit to one of the nails and the other to the knife blade. The circuit will be completed when the tripod cord is pulled or released.

**Section VII**
**No. 8**

**IMPROVISATION SCALE**

This scale provides a means of weighing propellant and other items when conventional scales or balances are not available.

**MATERIAL REQUIRED:**
- Pages from Improvised Munitions Handbook
- Straight sticks about 1 foot (30 cm) long and 1/4 in. (5 mm) in diameter
- Thread or fine string

**PROCEDURE:**

1. Make a notch about 1/2 in. (1 cm) from each end of stick. Be sure that the two notches are the same distance from the end of the stick.
2. Find the exact center of the stick by folding in half a piece of thread the same length as the stick and placing it alongside the stick as a ruler. Make a small notch at the center of the stick.
3. Tie a piece of thread around the notch. Suspend stick from branch, another stick wedged between rocks, or by any other means. Be sure stick is balanced and free to move.

**NOTE:** If stick is not balanced, shave or scrape a little off the heavy end until it does balance. Be sure the lengths of the arms are the same.

4. Make a container out of one piece of paper. This can be done by rolling the paper into a cylinder and folding up the bottom a few times.
5. Punch 2 holes at opposite sides of paper container. Suspend container from one side of stick.
6. Count out the number of handbook pages equal in weight to that of the quantity of material to be weighed. Each sheet of paper weighs about 1.3 grams (20 grains or .04 ounces). Suspend these sheets, plus one, to balance container on the other side of the scale.
7. Slowly add the material to be weighed to the container. When the stick is balanced, the desired amount of material is in the container.
8. If it is desired to weigh a quantity of material larger than that which would fit in the above container, make a container out of a larger paper or paper bag, and suspend from one side of the stick. Suspend handbook pages from the other side until the stick is balanced. Now place a number of sheets of handbook pages equal in weight to that of the desired amount of material to be weighed on one side, and fill the container with the material until the stick is balanced.
9. A similar method may be used to measure parts or percentage by weight. The weight units are unimportant. Suspend equal weight containers from each side of the stick. Bags, tin cans, etc. can be used. Place one material in one of the containers. Fill the other container with the other material until they balance. Empty and refill the number of times necessary to get the required parts by weight (e.g., 5 to 1 parts by weight would require 5 fillings of one can for one filling of the other).
ROPE GRENADE LAUNCHING TECHNIQUE

A method of increasing the distance a grenade may be thrown. Safety fuse is used to increase the delay time.

MATERIAL REQUIRED:
- Hand grenade (Improvised pipe hand grenade, Section II, No. 1 may be used)
- Safety fuse or fast burning Improvised Fuse, (Section VI, No. 7)
- Light rope, cord, or string

PROCEDURE:

1. Tie a 4 to 6 foot (1 meter) length of cord to the grenade. Be sure that the rope will not prevent the grenade handle from coming off.

Note: If improvised grenade is used, tie cord around grenade near the end cap. Tape in place if necessary.

2. Tie a large knot in the other end of the cord for use as a handle.

3. Carefully remove safety pin from grenade, holding safety lever in place. Enlarge safety pin hole with point of knife,awl, or drill so that safety fuse will pass through hole.

4. Insert safety fuse in hole. Be sure that safety fuse is long enough to provide a 10 second or more time delay. Slowly release safety lever to make sure fuse holds safety lever in place.

CAUTION: If safety lever should be released for any reason, grenade will explode after regular delay time (4-5 sec.).

NOTE: If diameter of safety fuse is too large to fit in hole (Step 4), follow procedure and How to Use of Time Delay Grenade, Section VI, No. 8, instead of Steps 3 and 4 above.

HOW TO USE:

1. Light fuse.

2. Whirl grenade overhead, holding knot at end of rope, until grenade picks up speed (3 or 4 turns).

3. Release when sighted on target.

CAUTION: Be sure to release grenade within 10 seconds after fuse is lit.

NOTE: It is helpful to practice first with a dummy grenade or a rock to improve accuracy. With practice, accurate launching up to 100 meters (300 feet) can be obtained.

BICYCLE GENERATOR POWER SOURCE

A 6 volt, 3 watt bicycle generator will set off one or two blasting caps (connected in series) or an igniter.

MATERIAL REQUIRED:
- Bicycle generator (6 volts, 3 watt)
- Copper wire
- Knife

PROCEDURE:

1. Strip about 4 in. (10 cm) of coating from both ends of 2 copper wires. Scrape ends with knife until metal is shiny.

2. Connect the end of one wire to the generator terminal.

3. Attach the end of the second wire to generator case. This wire may be wrapped around a convenient projection, taped, or simply held against the case with the hand.
HOW TO USE:

1. Connect free ends of wires to blasting cap or squib leads.

CAUTION: If drive wheel is rotated, explosive may be set off.

2. Run the drive wheel firmly and rapidly across the palm of the hand to activate generator.

NOTE: The F and G or C terminals may not be labeled; in this case, connect wires as shown. The F terminal is usually smaller in size than the C or G terminal.

3. Wrap several turns of string or wire clockwise around the drive pulley.

HOW TO USE:

1. Connect the free ends of the wires to the light bulb.

2. Place one foot on the generator to secure it in place. Give the string or wire a very hard pull to light the bulb.

NOTE: If not successful at first, rewind string and try again several times. After repeating this operation and the bulb still does not light, follow Step 4, "How to Use."

3. If light bulb lights, follow Steps 1 and 2 of above, "How to Use," connecting free ends of wires to blasting cap or igniter instead of to light bulb.

4. If light bulb does not light after several pulls, switch leads connected to F and G terminals. Repeat above "How to Use," Steps 1 to 3.

152

AUTOMOBILE GENERATOR POWER SOURCE

An automobile generator can be used as a means of firing one blasting cap or igniter. (Improvised igniter, Section V, No. 3, may be used.)

MATERIAL REQUIRED:

Automobile generator (6, 12, or 28 volts). (An alternator will not work.)
Copper Wire
Strong string or wire, about 5 ft. (150 cm) long and 1/16 in. (1-1/2 mm) in diameter
Knife
Small light bulb requiring same voltage as generator, (for example, bulb from same vehicle as generator).

PROCEDURE:

1. Strip about 1 in. (2-1/2 cm) of coating from both ends of 3 copper wires. Scrape ends with knife until metal is shiny.

2. Connect the A and F terminals with one piece of wire.

3. Connect a wire to the A terminal. Connect another to the G terminal.

Section VII
No. 11

153

String or Fine Wire

Drive Pulley

Section VII
No. 12

154

IMPROVISED BATTERY (SHORT LASTING)

This battery is powerful but must be used within 15 minutes after fabrication. One cell of this battery will detonate one blasting cap or one igniter. Two cells, connected in series, will detonate two of these devices and so on. Larger cells have a longer life as well as greater power.

MATERIALS

Water
Sodium hydroxide (lye, solid or concentrated solution)

COMMON SOURCE

Soap manufacturing
Disinfectants
Sewer cleaner

Copper or brass plate about
4 in. (10 cm) square and 1/16 in. (1 mm) thick
Improvised Munitions

铝板或片，尺寸与铜板相同
碳粉
混合容器
刀

选择其中一个：
高锰酸钾，固体
消毒剂
除臭剂
氢氧化钙，固体
消毒剂
水处理化学品
漂白剂
氧化锰（硬锰）
干电池

注：确保将氢氧化物溶液浓度至少为5%。

程序：

1. 使用刀从两根导线的两端刮掉表面，直到表面变亮。

2. 将粉末状的木炭与大约等体积的高锰酸钾等物料充分混合，将它们混合成糊状。向糊状物中加入水，直到形成膏状。

3. 将混合物涂成厚度为1/8英寸（2毫米）的层，放在铜板或黄铜板上。确保混合物足够厚，以防止混合物在两块金属板之间被密封，从而使这两块板不接触。

4. 预热后，确保铝板与铜板之间没有接触。将铝板与铜板连接。如果有连接线，则将线穿过孔，确保它们不接触。

注意：如果需要更多的能量，应准备更多的板。

使用方法：

1. 在不超出15分钟内，将一小量的氢氧化物溶液均匀地倒在每块板上。

注意：溶液不得接触皮肤或眼睛。

注意：如果溶液溅到皮肤上，立即用清水冲洗。
Charcoal powder
Copper or brass plate about 4 in. (10 cm) square and 1/16 in. (2 mm) thick
Aluminum plate same size as copper or brass plate
Wax and paper (or waxed paper) Candles
Wires, string or tape
Container for mixing
Knife
One of the following:
Potassium permanganate, solid Desinfectants
Manganese dioxide Deodorants
Dead dry batteries

NOTE: If ammonium chloride solution is not concentrated (at least 45% by weight), boil off some of the water.

PROCEDURE:
1. Mix thoroughly (do not grind) approximately equal volumes of powdered charcoal, ammonium chloride and one of the following: potassium permanganate or manganese dioxide. Add water until a very thick paste is formed. If ammonium chloride is in solution form, it may not be necessary to add water.

2. Spread a layer of this mixture, about 1/8 in. (3 mm) thick, on a clean copper or brass plate. The layer must be thick enough to prevent a second plate from touching the copper plate when it is pressed on top.

3. Press an aluminum plate very firmly upon the mixture on the copper plate. Remove completely any of the mixture that squeezes out between the plates. The plates must not touch.

4. If more than one cell is desired:
   a. Place one cell on top of the other so that unlike metal plates are touching.

HOW TO USE:
1. Scrape a few inches off each end of two wires with knife till metal is shiny.
2. Clean plates with knife until metal is shiny where connections are to be made.
3. Connect one wire from the explosive to a copper or brass plate and the other wire to an aluminum plate. The connection can be made by holding the wire against the plate. A permanent connection can be made by hooking the wire through holes in the exposed corners of the plates. The battery is now ready for use.

NOTE: If battery begins to fail after a few firings, scrape the plates and wires where connections are made until metal is shiny.

ARMOR MATERIALS

The following table shows the amount of indigenous materials needed to stop ball type projectiles of the 5.56 mm, .30 caliber, and .50 caliber ammunition fired from their respective weapons at a distance of 10 feet (3 m).

<table>
<thead>
<tr>
<th>Thickness of Materials</th>
<th>Inches</th>
<th>Centimeters</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.56 mm</td>
